Newcrest Reports Further Drilling Results at Havieron

Latest excellent infill drilling results confirm continuity of higher-grade mineralisation

2021 growth drilling programme: approximately 65,000 metres in next six months to test potential extensions to resource shell, new targets identified

Greatland Gold plc (AIM:GGP), the precious and base metals exploration and development company, is pleased to provide an update on Newcrest's drilling campaign at the Havieron deposit in the Paterson region of Western Australia. The Company notes the release of an ASX announcement titled "Quarterly Exploration Report" by Newcrest Mining Ltd ("Newcrest") earlier today.

Drilling since May 2019 has outlined an ovoid shaped zone of variable brecciation, alteration and sulphide mineralisation with dimensions of 650m x 350m trending in a north west orientation. Breccia mineralisation has been identified internally and externally to the Crescent Zone, including targets which remain open to the east, northwest and southeast. Mineralisation has been observed to over 1,000m in vertical extent below the post mineralisation cover sequence and remains open at depth.

During the last quarter of calendar 2020, drilling activities at Havieron primarily focused on ongoing infill drilling of the South East Crescent and Breccia Zone. This infill drilling was conducted to support the potential delivery of an Indicated Mineral Resource in the South East Crescent Zone and adjacent Breccia Zones. Assay results for a total of 18 new drill holes have been received since the last update (10 December 2020) and are reported here today.

Highlights

- **Further Excellent Results from Infill Drilling:** Latest drill results confirm the continuity of higher-grade mineralisation within the South East Crescent and Breccia. Mineralisation is open at depth below the Inferred Mineral Resource shell providing support for potential expansion at depth.
- **2021 Growth Drilling Programme:** The 2021 growth drilling programme includes plans for approximately 65,000 metres of drilling within the next six months and will focus on the following targets:
 - **South East Crescent and Breccia:** Potential resource definition of extensions below the existing resource shell and lateral extensions adjacent to the existing high grade resource shell.
 - **Northern Breccia:** Potential expansion of the existing Inferred Mineral Resource below and adjacent to the existing resource shell.

- **Eastern Breccia:** Drill testing and interpretation of the geological and mineralisation controls of the Eastern Breccia Zone is ongoing.
- **New Targets:** New targets outside of the immediate vicinity of the Havieron deposit, but within the Havieron Joint Venture area, have been identified with the potential to conduct drill testing of these targets in the future.
- **Early Works Underway:** As announced on 21 January 2021, earth moving activities to prepare for the construction of the box cut and decline have commenced, and work continues to investigate the potential to achieve commercial production at Havieron within three years of the commencement of the decline.

Best New Results - South East Crescent and Breccia¹ (not previously reported)

- *HAD025W1:* 111.7m @ 3.6g/t Au & 0.46% Cu from 804.7m, including
 - 40.2m @ 8.4g/t Au & 0.53% Cu from 816.8m
- *HAD109:* 37.7m @ 9.8g/t Au & 0.27% Cu from 814.3m
- *HAD110:* 140.3m @ 2.5g/t Au & 0.48% Cu from 554m, including
 - 37.7m @ 8.2g/t Au & 1.4% Cu from 580.4m
- *HAD110W1:* 134m @ 3.1g/t Au & 0.45% Cu from 558m, including
 - 22.9m @ 12g/t Au & 0.56% Cu from 659.1m
- *HAD113:* 121.7m @ 2.0g/t Au & 0.43% Cu from 708m
- *HAD113W1:* 108.6m @ 2.5g/t Au & 0.64% Cu from 742.4m

1. All widths reported here and below are downhole widths, generally greater than true widths.

Gervaise Heddle, Chief Executive Officer of Greatland Gold plc, commented: “As earth moving activities commence at Havieron, Newcrest continues to deliver excellent infill results within the existing resource shell and is launching an exciting 2021 growth drilling programme with the potential to further expand the mineralised footprint. The latest drill results increase our confidence in the continuity of higher-grade mineralisation and support the potential delivery of an Indicated Mineral Resource. Meanwhile, Newcrest’s plans for 65,000 metres of growth drilling will target several zones which could represent potential extensions to mineralisation outside of the Inferred Mineral Resource estimate, as well as new targets announced today within the Havieron joint venture area.

“Alongside the ramp-up of exploration and early works activities at Havieron, we are also preparing to launch our Juri Joint Venture exploration programme for 2021, which will focus on drill testing priority targets, including the Parlay target within the Black Hills Project and the Goliath, Outamind and Los Diablos targets within the Paterson Range East Project. We look forward to providing regular updates on activities at both joint ventures – Havieron and Juri – in due course.”

Analytical results for HAD025W1, HAD038W1, HAD056W2, HAD060W2, HAD060W4, HAD069W1, HAD069W2, HAD097, HAD107, HAD108, HAD109, HAD109W1, HAD110, HAD110W1, HAD111, HAD113, HAD113W1 and HAD114 have been received and are announced today (along with previously announced results for HAD048W1, HAD056W1, HAD057W4, HAD065W2, HAD081W1, HAD081W2, HAD083W1, HAD095, HAD096, HAD097W2, HAD098, HAD101, HAD102, HAD103 and HAD105) and are presented in Table 1. Drilling activities from 33 drill holes resulted in 26,591m of drilling completed since 30 September 2020.

Table 1 - Selected Significant Havieron Intercepts.

Hole ID	From (m)	To (m)	Width (m)	Gold (g/t)	Copper (%)
HAD025W1	804.7	916.4	111.7	3.6	0.46
Including	816.8	857	40.2	8.4	0.53
HAD109	814.3	852	37.7	9.8	0.27
HAD110	554	694.3	140.3	2.5	0.48
Including	580.4	618.1	37.7	8.2	1.40
HAD110W1	558	692	134	3.1	0.45
Including	659.1	682	22.9	12.0	0.56
HAD113	708	829.7	121.7	2.0	0.43
HAD113W1	742.4	851	108.6	2.5	0.64

HAD097W2^^	937.8	1057	119.2	2.7	0.40
HAD105^^	801.6	1100.4	298.8	1.2	0.11

^^ previously reported.

Reporting Criteria are listed in Appendix II

In addition to this release, a PDF version of this report with supplementary information can be found at the Company's website: www.greatlandgold.com/media/jorc/

Further Information on Newcrest Drilling and Operations at Havieron

Exploration activities at Havieron are operated by Newcrest under a Joint Venture Agreement with Greatland. The Havieron deposit is centered on a magnetic anomaly located 45km east of Telfer. Exploration drilling by Greatland during 2018 resulted in the discovery of significant gold and copper mineralisation under 400m of post mineralisation cover. Newcrest commenced drilling at Havieron during the June 2019 quarter and have completed 138,504m of drilling from 153 holes to date.

Drilling activity has progressively increased such that up to nine drill rigs were in operation during the quarter to 31 December 2020. Results reported today include 18 new drill holes (completed since the last release dated 10 December 2020) and relate to infill drilling of the South East Crescent and Breccia Zone. This infill drilling is to support the potential delivery of an Indicated Mineral Resource and associated studies. All new drill holes intersected mineralisation. Significant new results are presented in Table 1. The infill drilling results announced today are considered excellent.

Drilling since May 2019 has outlined an ovoid shaped zone of variable brecciation, alteration and sulphide mineralisation with dimensions of 650m x 350m trending in a north west orientation. Breccia mineralisation has been identified internally and externally to the Crescent zone, including targets which remain open to the east, northwest and southeast. Mineralisation has been observed to greater than 1000m in vertical extent below the post mineral cover sequence and remains open at depth. Within this ovoid shaped zone (at this stage) exploration has identified four key target regions, which are:

- South East Crescent and Breccia
- North West Crescent
- Northern Breccia
- Eastern Breccia

Drill data density in the **South East Crescent and adjacent Breccia** and a portion of the **Northern Breccia** has been sufficient for the definition of an Inferred Mineral Resource Estimate² for these domains. Reported inside an A\$50/t Net Smelter Royalty ("NSR") shell, the volume of identified mineralised geological domains where information to estimate the metal inventory and grades is at a sufficient magnitude and having the reasonable prospects of eventual economic extraction comprises:

- 52Mt @ 2.0g/t Au and 0.31% Cu for 3.4Moz Au and 160Kt Cu for 4.2Moz gold equivalent³, included in geological domains:
 - Crescent Zone containing 18Mt @ 3.8g/t Au and 0.61% Cu for 2.2Moz Au and 110Kt Cu; and
 - Breccia Zone containing 34Mt @ 1.1g/t Au and 0.15% Cu for 1.2Moz Au and 50Kt Cu.
2. Refer to Newcrest announcement titled "Newcrest announces initial Inferred Mineral Resource estimate for Haverton of 3.4Moz of gold and 160Kt of Copper" dated 10 December 2020 and available on www.asx.com.au under the code "NCM".
 3. The gold equivalent (AuEq) is based on assumed prices of US\$1,400/oz Au and US\$3.40/lb Cu, gold recoveries of 94% (Crescent) and 84% (Breccia), and copper recoveries of 84% (Crescent) and 82% (Breccia), which equates to a formula of approximately $AuEq = Au(g/t) + 1.65 * Cu(%)$. In Greatland's opinion all elements (gold and copper) have a reasonable potential to be recovered and sold.

Outside of the Inferred Mineral Resource estimate, mineralisation remains open with encouraging results identified from the South East Crescent and Breccia Zone, Northern Breccia Zone, and the Eastern Breccia Zone.

Within the **South East Crescent and Breccia Zones** 23 holes have been completed for the reporting period, including 18 new holes. These drill holes are infill holes within the Mineral Resource and confirm the continuity of higher grade mineralisation within the South East Crescent and Breccia Zone, including¹:

- HAD025W1
 - 111.7m @ 3.6g/t Au & 0.46% Cu from 804.7m
 - Including 40.2m @ 8.4g/t Au & 0.53% Cu from 816.8m
- HAD109
 - 37.7m @ 9.8g/t Au & 0.27% Cu from 814.3m
- HAD110
 - 140.3m @ 2.5g/t Au & 0.48% Cu from 554m
 - Including 37.7m @ 8.2g/t Au & 1.4% Cu from 580.4m
- HAD110W1
 - 134m @ 3.1g/t Au & 0.45% Cu from 558m
 - Including 22.9m @ 12g/t Au & 0.56% Cu from 659.1m
- HAD113
 - 121.7m @ 2.0g/t Au & 0.43% Cu from 708m
- HAD113W1
 - 108.6m @ 2.5g/t Au & 0.64% Cu from 742.4m
- HAD056W1^^
 - 205.8m @ 1.2g/t Au & 0.24% Cu from 598m
- HAD097W2^^
 - 119.2m @ 2.7g/t Au & 0.4% Cu from 937.8m

Mineralisation is open at depth below the Inferred Mineral Resource shell providing support for potential resource expansion at depth.

Further drilling of the **Northern Breccia Zone** included 10 drill holes during the reporting period (but no new holes since the 10 December 2020 update). Mineralisation has been identified in 23 drill holes to date which informed the Inferred Mineral Resource estimate. Results continue to support the continuity of mineralisation and demonstrate the opportunity to further expand the mineralisation footprint in this region. Results include¹:

- HAD101^^
 - 92.5m @ 1.9g/t Au & 0.06% Cu from 1296m
- HAD103^^
 - 90.6m @ 2.3g/t Au & 0.18% Cu from 776.4m
 - Including 2.4m @ 67g/t Au and 0.33% Cu from 822.7m
- HAD105^^
 - 298.8m @ 1.2g/t Au & 0.11% Cu from 801.6m
 - Including 15.8m @ 3.5g/t Au & 0.22% Cu from 821m

Mineralisation at the Havieron deposit has been identified internally and externally to the Crescent Zone, including targets which remain open to the east, northwest and southeast. Mineralisation has been observed to greater than 1000m in vertical extent below the post mineralisation cover sequence and remains open at depth. The extents of the Havieron system are still to be defined.

Approximately 65,000m of growth-related drilling is planned over the next two quarters. Further drilling of the Northern Breccia Zone is ongoing to support the potential expansion of the existing Inferred Mineral Resource. Drill testing and interpretation of the geological and mineralisation controls of the Eastern Breccia Zone is ongoing. Planned growth drilling will also target potential resource extensions of the South East Crescent and Breccia below and adjacent to the existing resource shell. Further targets outside of Havieron, but within the Havieron Joint Venture area, have been identified with the potential to conduct drilling to test these targets in the future.

Early studies are ongoing and include mining methods, hydrogeology, geotechnical, metallurgical, engineering and environmental to support delivery of a Pre-Feasibility Study in late 2021. Earth moving activities to prepare for the construction of the box cut and decline have commenced as announced 21 January 2021. Studies continue to investigate the potential to achieve commercial production within three years from commencement of the decline.

Additional drill hole information is presented in Appendix I and tabulated drill hole intercepts are presented in Appendix II. A 3D schematic plan view of Crescent Sulphide Zone and Breccia target zones is shown in Figure 1, a schematic horizontal slice through the Crescent Sulphide Zone and Breccia hosted mineralisation is shown in Figure 2, drill hole locations are shown in Figure 3 and Cross Sections are shown in Figures 4, 5, 6, 7 and 8.

Mineralisation in the Havieron deposit is hosted by metasedimentary (meta-sandstones, meta-siltstones and meta-carbonate) and intrusive rocks. Gold and copper mineralisation is hosted in breccia, vein and massive sulphide replacement styles, typical of intrusion-related and skarn types of mineralisation. The main sulphide mineral assemblage contains well developed pyrrhotite-chalcopyrite and pyrite. Alteration assemblages associated with mineralisation are amphibole-carbonate-biotite-sericite-chlorite. Higher grade gold zones (+10g/t Au) are often associated with quartz/chalcopyrite-pyrite veining.

Background to Havieron and Joint Venture Agreement with Newcrest

The Havieron Project is operated by Newcrest under a Joint Venture Agreement with Greatland. As announced on 30 November 2020, Newcrest has now met the Stage 3 expenditure requirement (US\$45 million) and is entitled to earn an additional 20% joint venture interest, resulting in an overall joint venture interest of 60% (Greatland 40%). Newcrest can earn up to a 70% joint venture interest through total expenditure of US\$65 million and the completion of a series of exploration and development milestones in a four-stage farm-in over a six year period that commenced in March 2019. Newcrest may acquire an additional 5% interest at the end of the farm-in period at fair market value.

The Joint Venture Agreement includes tolling principles reflecting the intention of the parties that, subject to a successful exploration programme and feasibility study and a positive decision to mine, the resulting joint venture mineralised material will be processed at Telfer, located 45km west of Havieron.

A regional map showing the Havieron licence area with regional targets and adjacent landholdings can be found at: www.greatlandgold.com/paterson

Juri Joint Venture

On 30 November 2020, Greatland and Newcrest entered into the Juri Joint Venture, which is a farm-in and joint venture agreement with respect to Greatland's Black Hills and Paterson Range East projects, located within the Paterson Province approximately 50km from the Telfer operation. The new joint venture covers an area of approximately 248km².

Under the terms of the agreement, Newcrest has been granted an initial 25% joint venture interest with the potential to earn up to a 75% joint venture interest through total expenditure of A\$20 million over a two stage earn-in, across a five year period. Greatland will manage the Juri Joint Venture until the end of calendar year 2021, after which Newcrest has the right to be appointed as Manager.

Newcrest and Greatland have agreed an exploration programme until the end of calendar year 2021 which is anticipated to drill test priority targets, including the Parlay target within the Black Hills Project and the Goliath, Outamind and Los Diablos targets within the Paterson Range East Project. Additionally, geophysical work will be conducted in calendar year 2021 to identify other potential targets within both projects.

Figure 1. 3D Plan view schematic showing the spatial association of the South East Crescent + Breccia, North West Crescent, Northern Breccia and newly recognised Eastern Breccia targets outline projected to surface.

Figure 2. Plan view schematic of a horizontal slice at 4700mRL through the Crescent Sulphide Zone and Breccia-hosted Zones, showing the extents of the 0.5 and 1.0 g/t Au Leapfrog grade shells with highlighted newly reported intercepts since the Quarterly Exploration Report released on 29 October 2020. Drilling previous to 29/10/2020 is not shown for clarity. Also shown is the Northern Breccia 1 g/t Au Leapfrog shell projected from 4400mRL. Drilling is ongoing to confirm the extent of the Northern and Eastern Breccias.

Figure 3. Schematic plan view map showing drill hole locations and significant intercepts reported in this release superimposed on the interpreted geology. Drilling previous to 29/10/2020 is not shown for clarity.

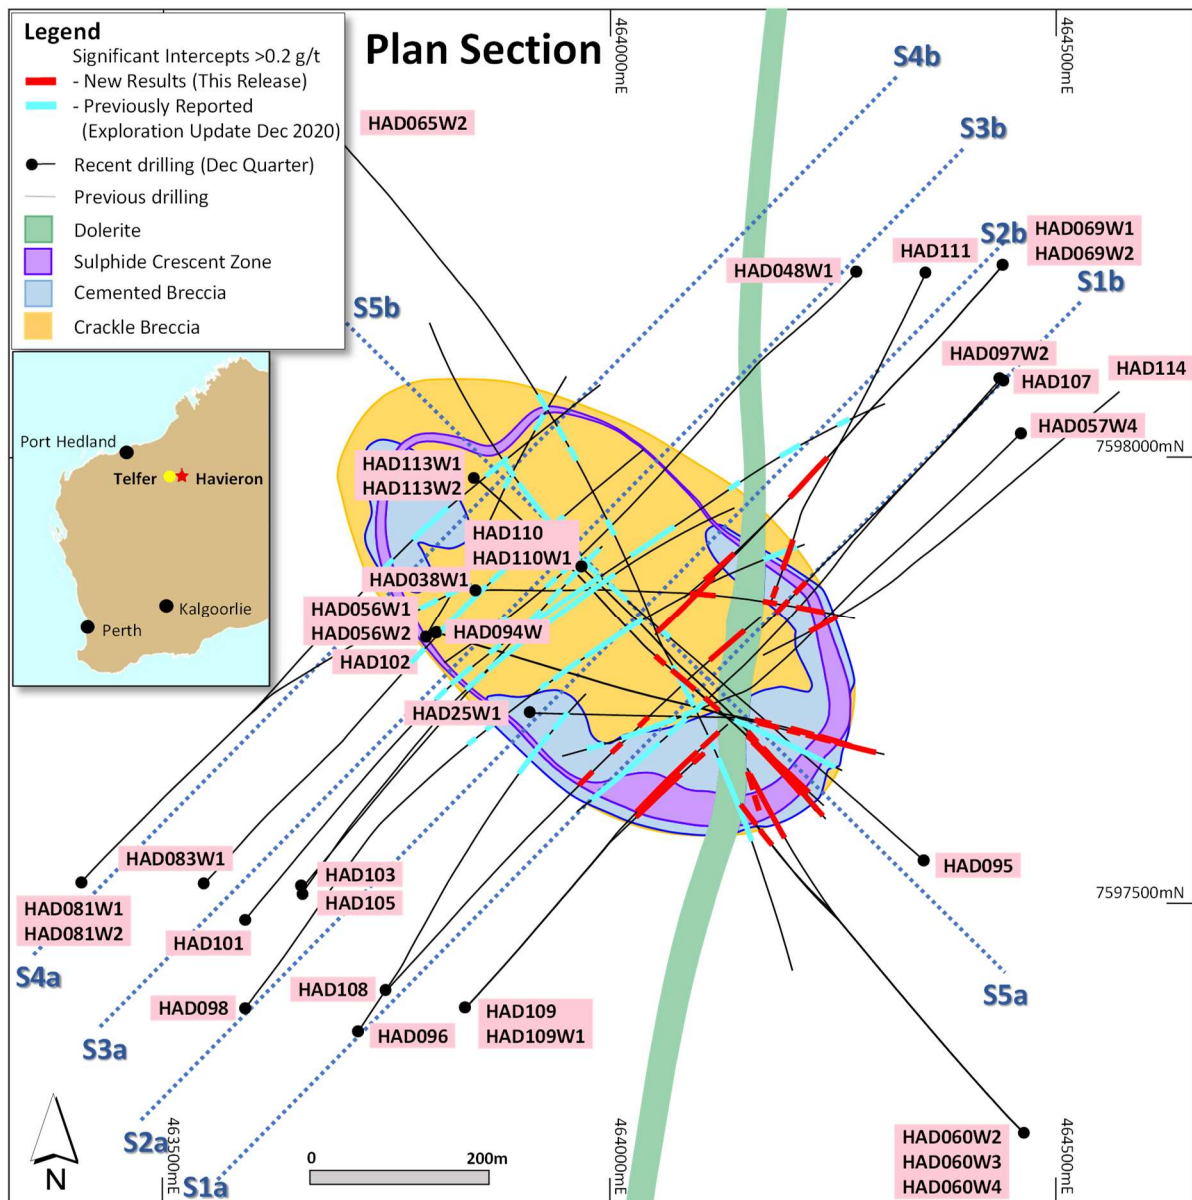

Figure 4. Schematic cross section of geology and significant drillhole intercepts (looking northwest, Section Line S1a-S1b, 200m section width, as shown in Figure 3), showing new and previously reported drilling.

Figure 5. Schematic cross section of geology and significant new drillhole intercepts (looking north, Section Line S2a-S2b, 200m section width, as shown in Figure 3), showing new and previously reported drilling.

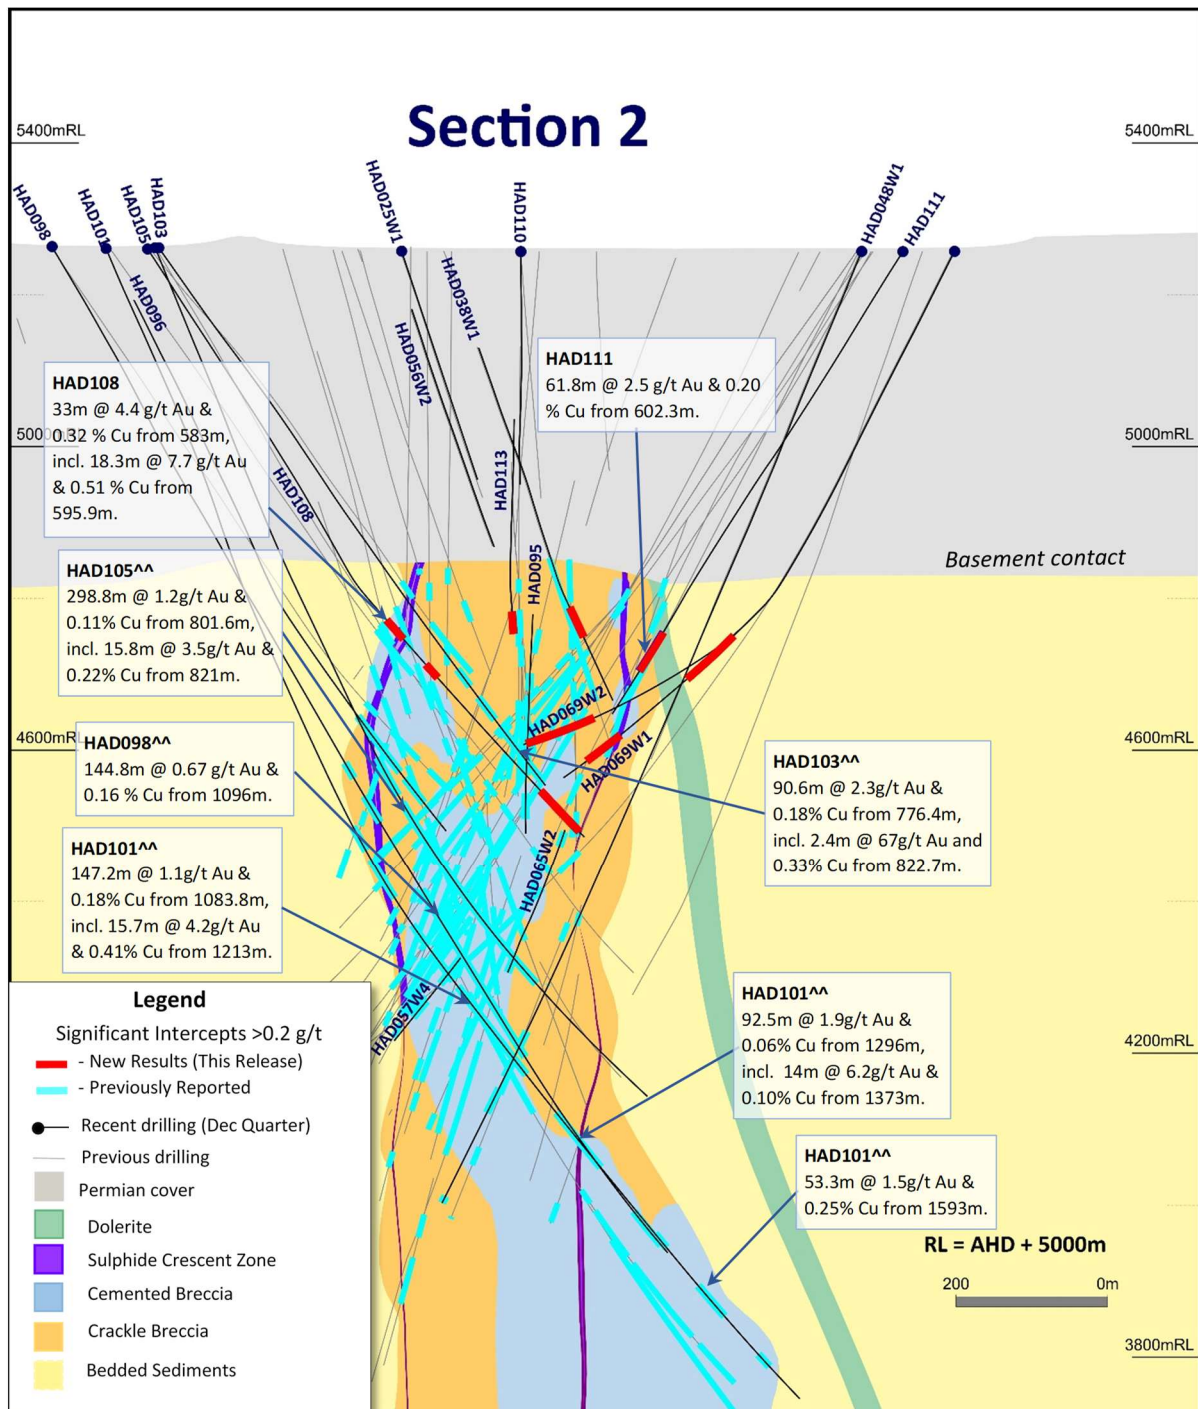

Figure 6. Schematic cross section (looking northwest, Section Line S3a-S3b, 200m section width, as shown in Figure 3), showing new and previously reported drilling.

Figure 7. Schematic cross section of geology and significant new drillhole intercepts (looking northwest, Section Line S4a-S4b, 200m section width, as shown in Figure 3), showing new and previously reported drilling.

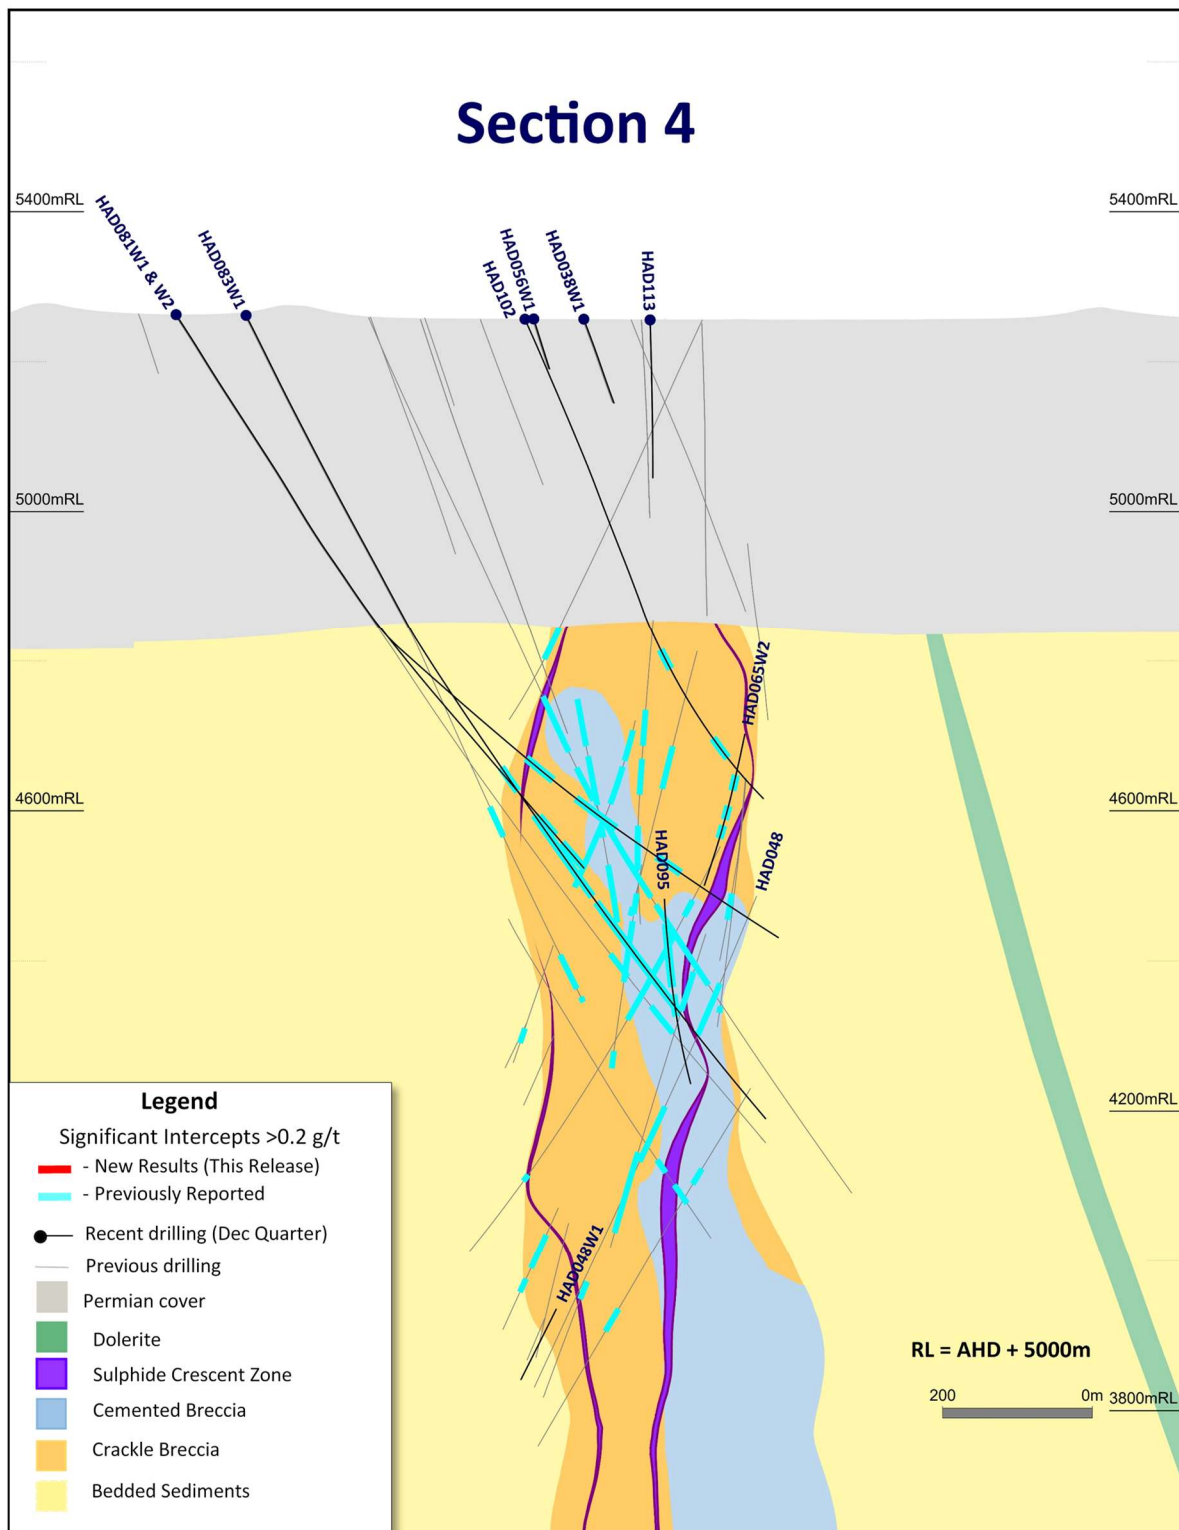

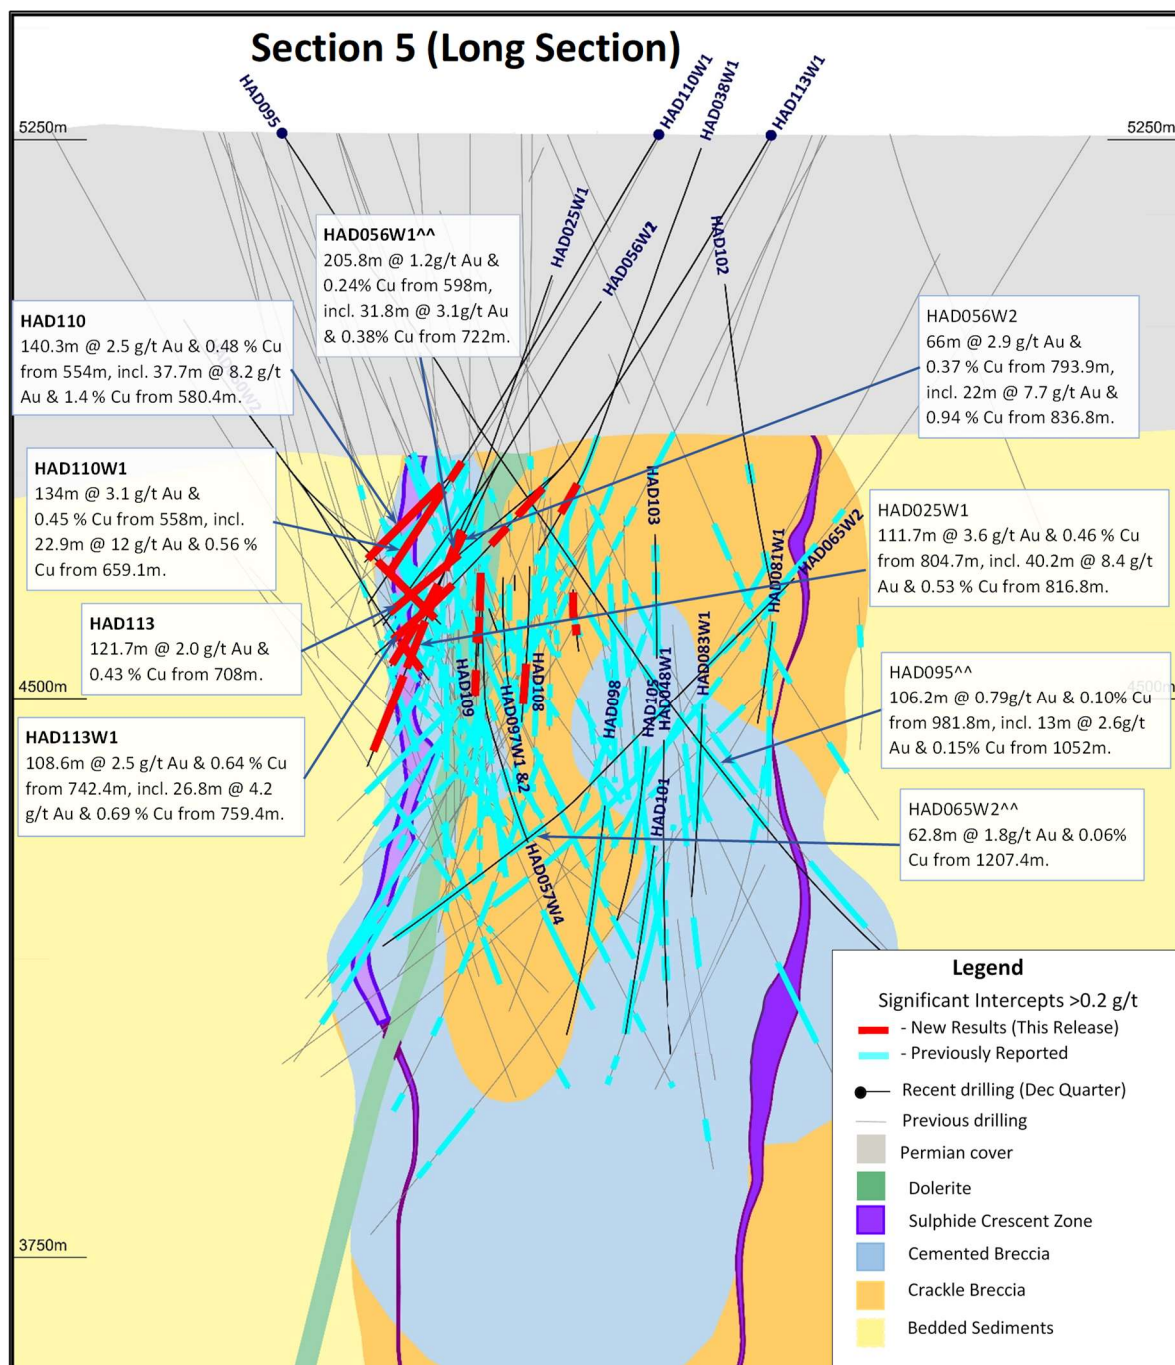

Figure 8. Schematic cross section of geology and significant new drillhole intercepts (looking southwest, Section Line 5a-5b, 200m section width, as shown in Figure 3), showing new and previously reported drilling.

Information in this announcement pertaining to Reporting of Exploration Results, which has been taken from Newcrest Mining Limited's announcement titled “Quarterly Exploration Report for the three months ended 31 December 2020”, dated 28 January 2021, has been reviewed and approved by Mr John McIntyre, a Member of the Australian Institute of Geoscientists (MAIG), who has more than 30 years relevant industry experience. Mr McIntyre is a full-time consultant to the Company and has no financial interest in Greatland Gold plc or its related entities. Mr McIntyre has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code) and under the AIM Rules - Note for Mining and Oil & Gas Companies, which outline standards of disclosure for mineral projects. Mr McIntyre consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears. Mr McIntyre confirms that the Company is not aware of any new information or data that

materially affects the information included in the relevant market announcements, and that the form and context in which the information has been presented has not been materially modified.

Additional information on the project can be found on the Company's website at www.greatlandgold.com/paterson/

Notes for Editors:

Greatland Gold plc is a London Stock Exchange AIM-listed (AIM:GGP) natural resource exploration and development company with a current focus on precious and base metals. The Company has six main projects; four situated in Western Australia and two in Tasmania.

In March 2019, Greatland signed a Farm-in Agreement with Newcrest Operations Limited, a wholly-owned subsidiary of Newcrest Mining Limited (ASX:NCM), to explore and develop Greatland's Havieron gold-copper deposit in the Paterson region of Western Australia. The Havieron Project is operated by Newcrest under a Joint Venture Agreement with Greatland Gold plc. Newcrest can earn up to a 70% joint venture interest through total expenditure of US\$65 million and the completion of a series of exploration and development milestones in a four-stage farm-in over a six year period that

commenced in March 2019. Newcrest may acquire an additional 5% interest at the end of the farm-in period at fair market value.

The Joint Venture Agreement includes tolling principles reflecting the intention of the parties that, subject to a successful exploration programme and feasibility study and a positive decision to mine, the resulting joint venture mineralised material will be processed at Telfer, located 45km west of Havieron.

Greatland is seeking to identify large mineral deposits in areas that have not been subject to extensive exploration previously. It is widely recognised that the next generation of large deposits will come from such under-explored areas and Greatland is applying advanced exploration techniques to investigate a number of carefully selected targets within its focused licence portfolio.

The Company is also actively investigating a range of new opportunities in precious and strategic metals and will update the market on new opportunities as and when appropriate.

APPENDIX I

Havieron Project (Greatland Gold plc – Joint Venture Agreement): JORC Table 1

Section 1 Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Core samples are obtained from core drilling in Proterozoic basement lithologies. PQ-HQ and NQ diameter core was drilled on a 6m run. Core was cut using an automated core-cutter and half core sampled at 1m intervals with breaks for major geological changes. Sampling intervals range from 0.2 – 1.0m. Cover sequences were not sampled.
Drilling techniques	<p>Permian Paterson Formation cover sequence was drilled using mud rotary drilling. Depths of cover typically observed to approximately 420m vertically below surface. Steel casing was emplaced to secure the pre-collar.</p> <p>Core drilling was advanced from the base of the cover sequence with PQ3, HQ3 and NQ2 diameter coring configuration.</p> <p>Core from inclined drill holes are oriented on 3m and 6m runs using an electronic core orientation tool (Reflex ACTIII). At the end of each run, the bottom of hole position is marked by the driller, which is later transferred to the whole drill core run length with a bottom of hole reference line.</p>
Drill sample recovery	<p>Core recovery is systematically recorded from the commencement of coring to end of hole, by reconciling against driller's depth blocks in each core tray with data recorded in the database. Drillers depth blocks provided the depth, interval of core recovered, and interval of core drilled.</p> <p>Core recoveries were typically 100%, with isolated zones of lower recovery.</p> <p>Cover sequence drilling by the mud-rotary drilling did not yield recoverable samples.</p>
Logging	<p>Geological logging recorded qualitative descriptions of lithology, alteration, mineralisation, veining, and structure (for all core drilled – 19,855m from 33 drillholes, all intersecting mineralisation), including orientation of key geological features.</p> <p>Geotechnical measurements were recorded including Rock Quality Designation (RQD) fracture frequency, solid core recovery and qualitative rock strength measurements.</p> <p>Magnetic susceptibility measurements were recorded every metre. The bulk density of selected drill core intervals was determined at site on whole core samples.</p> <p>All geological and geotechnical logging was conducted at the Havieron site.</p> <p>Digital data logging was captured on diamond drill core intervals only, and all data validated and stored in an acQuire database.</p> <p>All drill cores were photographed, prior to cutting and/or sampling the core.</p> <p>The logging is of sufficient quality to support Mineral Resource estimates.</p>
Sub-sampling techniques and sample preparation	<p>Sampling, sample preparation and quality control protocols are considered appropriate for the material being sampled.</p> <p>Core was cut and sampled at the Telfer and Havieron core processing facility. Half core samples were collected in pre-numbered calico bags and grouped in plastic bags for dispatch to the laboratory. Sample weights typically varied from 0.5 to 4kg. Sample sizes are considered appropriate for the style of mineralisation. Drill core samples were freighted by air and road to the laboratory.</p> <p>Sample preparation was conducted at the independent ISO17025 accredited Intertek Laboratory, Perth (Intertek). Samples were dried at 105°C, and crushed to 95% passing 4.75mm, and the split to obtain up to 3kg sub-sample, which was pulverised (using LM5) to produce a pulped product with the minimum standard of 95% passing 106µm, the sample and 10 samples either side are re-ground or re-screened. There are very few instances of <95% passing the second grind. An assessment of the grind size verses Au grade has shown that rare mineralised assays are affected by grinding issues.</p> <p>Duplicate samples were collected from crush and pulp samples at a rate of 1:20. Duplicate results show an acceptable level of variability for the material sampled and style of mineralisation.</p>

Criteria	Commentary
	Periodic size checks (1:20) for crush and pulp samples and sample weights are provided by the laboratory and recorded in the acQuire database.
Quality of assay data and laboratory tests	<p>Assaying of drill core samples was conducted at Intertek. All samples were assayed for 48 elements using a 4-acid digestion followed by ICP-AES/ICP-MS determination (method 4A/MS907), which is considered to provide a total assay for copper. Gold analyses were determined by 50g fire assay with AAS finish (method FA50N/AA), which is considered to provide a total assay for gold.</p> <p>Sampling and assaying quality control procedures consisted of inclusion of certified reference material (CRMs), coarse residue and pulp duplicates with each batch (at least 1:20).</p> <p>Assays of quality control samples were compared with reference samples in acQuire database and verified as acceptable prior to use of data from analysed batches.</p> <p>Laboratory quality control data, including laboratory standards, blanks, duplicates, repeats and grind size results are captured in the acQuire database and assessed for accuracy and precision for recent data.</p> <p>Extended quality control programs including pulp samples submitted to an umpire laboratory and combined with more extensive re-submission programs have been completed.</p> <p>Analysis of the available quality control sample assay results indicates that an acceptable level of accuracy and precision has been achieved and the database contains no analytical data that has been numerically manipulated.</p> <p>The assaying techniques and quality control protocols used are considered appropriate for the data to be used for reporting exploration drilling results.</p>
Verification of sampling and assaying	<p>Sampling intervals defined by the geologist are electronically assigned sample identification numbers prior to core cutting. Corresponding sample numbers matching pre-labelled calico bags are assigned to each interval.</p> <p>All sampling and assay information were stored in a secure acQuire database with restricted access.</p> <p>Electronically generated sample submission forms providing the sample identification number accompany each submission to the laboratory. Assay results from the laboratory with corresponding sample identification are loaded directly into the acQuire database.</p> <p>Assessment of reported significant assay intervals was verified by re-logging of diamond drill core intervals and assessment of high resolution core photography. The verification of significant intersections has been completed by Newcrest personnel and Newcrest's Competent Person/Qualified Person. John McIntyre, Greatland's Competent Person, has reviewed and validated the significant intersections.</p> <p>No adjustments are made to assay data, and no twinned holes have been completed.</p> <p>There are no currently known drilling, sampling, recovery, or other factors that could materially affect the accuracy or reliability of the data.</p>
Location of data points	<p>Drill collar locations were surveyed using a differential GPS with GNSS with a stated accuracy of +/- 0.5m for all drill holes reported.</p> <p>Drill rig alignment was attained using an electronic azimuth aligner. Downhole survey was collected at 6-12m intervals in the cover sequence, and every 6 to 30m in diamond drill core segments of the drill hole using single shot (Axis Mining Champ Gyro). The single shot surveys have been validated using continuous survey to surface (Axis Mining Champ) along with a selection of drill holes re-surveyed by an external survey contractor using a DeviGyro tool - confirming sufficient accuracy for downhole spatial recording.</p> <p>A LIDAR survey was completed over the project area in Nov 2019 which was used to prepare a DEM / topographic model for the project with a spatial accuracy of +/- 0.1m vertical and +/- 0.3m horizontal. The topography is generally low relief to flat, elevation within the dune corridors in ranges between 250-265m Australian Height Datum (AHD) steepening to the southeast. All collar coordinates are provided in the Geocentric Datum of Australian (GDA20 Zone 51). All relative depth information is reported in AHD +5000m.</p>
Data spacing and distribution	<p>Within the South-East Crescent and Breccia zone drill hole spacing ranges from 50 to 100m, to 50 by 50m within the initial resource extents. Outside the initial resource boundary drill hole spacing ranges from 50 to 200m in lateral extent within the breccia zone over an area of ~2km². The data spacing is sufficient to establish the degree of geological and grade continuity.</p> <p>Significant assay intercepts remain open. Further drilling is required to determine the extent of currently defined mineralisation. No sample compositing is applied to samples.</p>

Criteria	Commentary
	Drilling intersects mineralisation at various angles.
Orientation of data in relation to geological structure	<p>Drill holes exploring the extents of the Havieron mineral system intersect moderately dipping carbonate and siliclastic sedimentary facies, mineralised breccia and sub-vertical intrusive lithologies. Geological modelling has been interpreted from historic and Newcrest drill holes.</p> <p>Variable brecciation, alteration and sulphide mineralisation is observed with a footprint with dimensions of 650m x 350m trending in a north west orientation and over 1000m in vertical extent below cover.</p> <p>The subvertical southeast high grade arcuate crescent sulphide zone has an average thickness of 20m and has been defined over a strike length of up to 550m, and over 600m in vertical extent below cover.</p> <p>Drilling direction is oriented to intersect the steeply dipping high-grade sulphide mineralisation zones at an intersection angle of greater than 40 degrees. The drilled length of reported intersections is typically greater than true width of mineralisation.</p>
Sample security	<p>The security of samples is controlled by tracking samples from drill rig to database.</p> <p>Drill core was delivered from the drill rig to the Havieron core yard every shift. On completion of geological and geotechnical logging, core processing was completed by Newcrest personnel at the Telfer facility but subsequently completed at the Havieron facility.</p> <p>High resolution core photography and cutting of drill core was undertaken at the Havieron or Telfer core processing facilities.</p> <p>Samples were freighted in sealed bags by air and road to the Laboratory, and in the custody of Newcrest representatives. Sample numbers are generated directly from the database. All samples are collected in pre-numbered calico bags.</p> <p>Verification of sample numbers and identification is conducted by the laboratory on receipt of samples, and sample receipt advise issued to Newcrest.</p> <p>Details of all sample movement are recorded in a database table. Dates, Hole ID sample ranges, and the analytical suite requested are recorded with the dispatch of samples to analytical services. Any discrepancies logged at the receipt of samples into the analytical services are validated.</p>
Audits or reviews	<p>Internal reviews of core handling, sample preparation and assays laboratories were conducted on a regular basis by both project personnel and owner representatives.</p> <p>In the Competent Person's opinion, the sample preparation, security and analytical procedures are consistent with current industry standards and are entirely appropriate and acceptable for the styles of mineralisation identified and will be appropriate for use in the reporting of exploration results and Mineral Resource estimates. There are no identified drilling, sampling or recovery factors that materially impact the adequacy and reliability of the results of the drilling programme in place at the Havieron Project.</p>

Section 2 Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	<p>The Havieron Project is entirely contained within mining tenement M45/1287, which is jointly owned by Greatland Pty Ltd and Newcrest Operations Limited. Newcrest has entered into a Joint Venture Agreement (effective 30 November 2020) and Farm-In Agreement (effective 12 March 2019) with Greatland Pty Ltd and Greatland Gold plc. Newcrest is the manager of the Havieron Project. Newcrest has now met the Stage 3 expenditure requirement (US\$45 million) and is entitled to earn an additional 20% joint venture interest, resulting in an overall joint venture interest of 60%. Newcrest has the right to earn up to a 70% interest and acquire a further 5% at fair market value.</p> <p>Newcrest and the Western Desert Lands Aboriginal Corporation are parties to an Indigenous Land Use Agreement (ILUA) which relates to the use of native title land for Newcrest's current operations at Telfer and its activities within a 60-km radius around Telfer and includes its exploration activities at Havieron. The parties have agreed that the ILUA will apply to any future development activities by the Joint Venture Participants (Newcrest and Greatland Gold) at Havieron.</p> <p>The mining tenement M45/1287 wholly replaces the 12 sub-blocks of exploration tenement E45/4701 (former exploration tenement on which the Havieron Project is based) and was granted on 10 September 2020. All</p>

	obligations with respect to legislative requirements including minimum expenditure are maintained in good standing for prior exploration tenement E45/4701.
Exploration done by other parties	<p>Newcrest completed six core holes in the vicinity of the Havieron Project from 1991 to 2003. Greatland Gold completed drill targeting and drilling of nine Reverse Circulation (RC) drill holes with core tails for a total of approximately 6,800m in 2018. Results of drilling programs conducted by Greatland Gold have previously been reported on the Greatland Gold website.</p> <p>Drilling has defined an intrusion-related mineral system with evidence of breccia and massive sulphide-hosted higher-grade gold-copper mineralisation.</p>
Geology	<p>The Havieron Project is located within the north-western exposure of the Palaeo-Proterozoic to Neoproterozoic Paterson Orogen (formerly Paterson Province), 45 km east of Telfer. The Yeneena Supergroup hosts the Havieron prospect and consists of a 9km thick sequence of marine sedimentary rocks and is entirely overlain by approximately 420m of Phanerozoic sediments of the Paterson Formation and Quaternary aeolian sediments.</p> <p>Gold and copper mineralisation at Havieron consist of breccia, vein and massive sulphide replacement gold and copper mineralisation typical of intrusion-related and skarn styles of mineralisation. Mineralisation is hosted by metasedimentary rocks (meta-sandstones, meta-siltstones and meta-carbonate) and intrusive rocks of an undetermined age. The main mineral assemblage contains well developed pyrrhotite-chalcocopyrite and pyrite sulphide mineral assemblages as breccia and vein infill, and massive sulphide lenses. The main mineralisation event is associated with amphibole-carbonate-biotite-sericite-chlorite wall rock alteration. Drilling has partially defined the extents of mineralisation which are observed over 650m by 350m within an arcuate shaped mineralised zone, and to depths of up to 1400m below surface.</p>
Drill hole Information	As provided in Appendix II.
Data aggregation methods	Significant assay intercepts are reported as (A) length-weighted averages exceeding 1.0g/t Au greater than or equal to 10m, with a maximum of 5m consecutive internal dilution; and (B) length-weighted averages exceeding 0.2g/t Au for greater than or equal to 20m, with a maximum of 10m consecutive internal dilution, and (C) intervals of >30g/t with no internal dilution which are greater or equal to 30 gram metres (Au_ppm x length). No top cuts are applied to intercept calculations.
Relationship between mineralisation widths and intercept lengths	Significant assay intervals reported represent apparent widths. Drilling is not always perpendicular to the dip of mineralisation and true widths are less than downhole widths. Estimates of true widths will only be possible when all results are received, and final geological interpretations have been completed.
Diagrams	Figures 1 through 8 as provided.
Balanced reporting	<p>This is the thirteenth release of Exploration Results for this project made by Newcrest. Previous release dates are 25 July 2019, 10 September 2019, 24 October 2019, 2 December 2019, 30 January 2020, 11 March 2020, 30 April 2020, 11 June 2020, 23 July 2020, 10 September 2020, 29 October 2020 and 10 December 2020.</p> <p>Earlier reporting of exploration programs conducted by Newcrest and Greatland Gold have previously been reported. Exploration drilling programs are ongoing and further material results will be reported in subsequent Newcrest releases.</p>
Other substantive exploration data	Nil
Further work	<ul style="list-style-type: none"> Follow up or extension drilling is planned on the following key targets: South East Crescent and Breccia – resource definition of extensions below existing resource shell and lateral extensions adjacent to the existing high grade resource shell; North West Crescent – depth extensions below existing resource shell; Northern Breccia – drilling is ongoing to support the potential expansion of the existing Inferred Mineral Resource adjacent to crescent and depth extensions; and Eastern Breccia – drill testing and interpretation of the geological and mineralisation controls on the Eastern Breccia

APPENDIX II

Drillhole Data

Havieron Project, Paterson, Western Australia

*Reporting Criteria: Intercepts reported are downhole drill width (not true width) Au >0.20ppm (0.2g/t Au) and minimum 20m downhole width with maximum consecutive internal dilution of 10m. Average grades are based on length-weighting of uncut sample grades. Also highlighted are high grade intervals of Au >1.0ppm (1g/t Au) and minimum 10m downhole width with maximum consecutive internal dilution of 5m, and intervals of >30g/t with no internal dilution which are greater or equal to 30 gram metres (Au_ppm x length) are tabled. Gold grades are reported to two significant figures, the downhole lengths are rounded to 0.1m which may cause some apparent discrepancies in interval widths. Samples are from core drilling which is PQ, HQ or NQ in diameter. Core is photographed and logged by the geology team before being cut. Half core PQ, HQ and NQ samples are prepared for assay and the remaining material is retained in the core farm for future reference. Each assay batch is submitted with duplicates and standards to monitor laboratory quality. Total depth (end of hole) is rounded to one decimal place for reporting purposes. Collars denoted with a * show partial results, with further significant assays to be reported in subsequent exploration updates.*

*Hole ID denoted with * partial results, assays pending; ** partial intercept, assays pending; ^ updated intercept or ^^ previously reported intercept*
