28 October 2021

THIS ANNOUNCEMENT CONTAINS INSIDE INFORMATION AS STIPULATED UNDER THE UK VERSION OF THE MARKET ABUSE REGULATION NO 596/2014 WHICH IS PART OF ENGLISH LAW BY VIRTUE OF THE EUROPEAN (WITHDRAWAL) ACT 2018, AS AMENDED. ON PUBLICATION OF THIS ANNOUNCEMENT VIA A REGULATORY INFORMATION SERVICE, THIS INFORMATION IS CONSIDERED TO BE IN THE PUBLIC DOMAIN.

Greatland Gold plc
("Greatland" or "the Company")

Havieron Exploration and Development Update

Havieron continues to improve with the best gram-metre intercept to date at 120.4m @ 10.0g/t Au & 0.66% Cu (HAD117W6)

Growth Drilling beneath the existing South-East Crescent Resource demonstrates increasing grade and thickness with the high grade mineralisation extended 250m

Multiple tremendous high grade intercepts support the potential for resource expansion across all zones and include:

- *South East Crescent: 44.7m @ 7.1g/t Au & 0.17% Cu (HAD86W3)*
- *Northern Breccia: 72.3m @1.4g/t Au & 0.07% Cu (HAD147W2)*
- *Eastern Breccia 43.3m @2.7g/t Au & 0.06% Cu (HAD084W2)*

Greatland Gold plc (AIM:GGP), a leading mining development and exploration company with a focus on precious and base metals, is pleased to provide an update on the drilling campaign at the Havieron gold-copper project in the Paterson region of Western Australia. The Company notes the release of an ASX announcement titled "Quarterly Exploration Report" by Newcrest Mining Ltd ("Newcrest") earlier today.

The latest results comprise 22 new drill holes from the Infill and Growth Drilling programmes plus 11 holes previously reported. Significant mineralisation was reported in 18 of the new holes. The Havieron joint venture has now completed a total of 210,629 of drilling from 254 holes, with all the latest completed holes continuing to intersect mineralisation, and all but one reporting significant mineralisation. A further 24 drill holes have been completed, awaiting assay.

Drilling activities since the last update include new results, which continue to support the potential for resource expansion of the Havieron gold-copper project. With 90,000 meters of Growth Drilling targeted to 30 June 2022.

Highlights

- **Results received from infill drilling support the modelled grade and thickness within the South East Crescent Zone Mineral Resource extents**.
  - The results support the continuity of the high grade Crescent Zone, and in some places appear to upgrade the zone
  - HAD117W6 returned 120.4m @ 10g/t Au & 0.66% Cu from 764.6m. This is the best gram metre intercept drilled to date at Havieron (Au_ppm x intercept length of 1,204 gram metres Au).

- **Further significant results from Growth Drilling continue to demonstrate the potential for resource additions outside of the existing Inferred Mineral Resource limits, including:**
    - Extension of the SE Crescent Zone below the current Mineral Resource, where increasing grade and thickness of mineralisation has been observed from recent drilling
    - Expansion of multiple higher-grade targets including Northern Breccia and NW Pod
    - Potential for additional NW trending corridors including the Eastern Breccia

- **Growth Drilling programme continues into FY22, targeting:**
    - **North West Crescent and Northern Breccia:** Zone of initial focus aimed at providing support for the potential expansion of the existing Inferred Mineral Resource.
    - **Eastern Breccia:** Drill testing and interpretation of the geological and mineralisation controls is ongoing.
    - **South East Crescent and Breccia:** Targeting potential resource definition of extensions below the existing resource shell and lateral extensions adjacent to the existing high-grade resource shell.
    - **New Targets:** Identified outside of the immediate vicinity of the Havieron deposit, but within the Havieron Joint Venture area, with the potential to conduct drill testing of these targets in the future.

- **Early Works advancing:** Construction activities are progressing well with achievements including (as of 20 October 2021):
    - Box cut and portal completed in May 2021 as at 20 October 2021
    - Exploration decline has advanced 211 metres
    - Decline contractor operating 24-hour per day
    - Planning has commenced for the first ventilation shaft, scheduled to begin during the next quarter.
    - Works to progress the necessary approvals and permits required to commence the development of an operating underground mine and associated infrastructure at the Havieron Project are ongoing

- **Feasibility Study progressing:** Feasibility study work by Newcrest continuing along with concurrent studies assessing boarder growth options for Havieron. Significant upside opportunities are being evaluated to increase the scale and life of Havieron, as well as presenting the opportunity to adopt alternative, lower cost, mining methods. The Feasibility Study still forecasted to be delivered December quarter 2022.

Shaun Day, Chief Executive Officer of Greatland Gold plc, commented: *"The volume and quality of results at Havieron continue to impress as we observe increases in both grade and thickness at depth. This supports continuity of the high grade zonations and potential upgrades to the mineralisation. It speaks volumes for the tremendous quality of Havieron that after reaching a milestone of 200,000 metres of drilling, the best gram metre intercept ever drilled was just delivered, located at the high grade South East Crescent Zone.*

The results of the 90,000 metres Growth Drilling programme continue to extend mineralisation across multiple zones across Havieron. These outstanding results expand the high-grade South East Crescent Zone and add further scale to the Havieron deposit in multiple directions including within the Northern Breccia and in the Eastern Breccia.

The ongoing success from each set of drill results confirm Havieron as a world class gold-copper project and its potential to expand further in scale. The Pre-feasibility study highlighted the low capex, low risk approach to developing Havieron, which puts this asset in a class of its own as we progress it forward and add further upside to its future economic outcomes."

Significant New Results (intercepts are reported as downhole width not true width)

South East Crescent

- **HAD053W3**
  - 75.4m @ 2.9g/t Au & 0.13% Cu from 987.3m
  - Including 14.7m @ 13g/t Au & 0.12% Cu from 1,031.5m
- **HAD064W1**
  - 42.4m @ 2.5g/t Au & 0.08% Cu from 705.6m
  - 26.9m @ 2.3g/t Au & 0.02% Cu from 772.1m
  - Including 12m @ 4.7g/t Au & 0.02% Cu from 787m
- **HAD086W3**
  - 44.7m @ 7.1g/t Au & 0.17% Cu from 1,412m
  - Including 20.2m @ 15g/t Au & 0.29% Cu from 1,421m
- **HAD117W4**
  - 78.1m @ 2.1g/t Au & 0.20% Cu from 762m
  - including 13.8m @ 3.7g/t Au & 0.18% Cu from 793.9m
  - Including 10.8m @ 3.6g/t Au & 1.0% Cu from 829.4m
- **HAD117W5**
  - 111.0m @ 1.1g/t Au & 0.03% Cu from 715m
- **HAD117W6**
  - 120.4m @ 10g/t Au & 0.66% Cu from 764.6m
  - Including 27.1m @ 18g/t Au & 1.0% Cu from 812.2m
  - Including 14m @ 38g/t Au & 1.2% Cu from 845m
- **HAD133W3**
  - 29.1m @ 3.2g/t Au & 0.09% Cu from 1,261.9m
  - 44.4m @ 5.7g/t Au & 0.11% Cu from 1,306.6m
  - 52.0m @ 3.2g/t Au & 0.42% Cu from 1,362m

Northern Breccia

- **HAD069W4**
  - 22.5m @ 2.6g/t Au & 0.15% Cu from 1,281m
- **HAD081W3**
  - 52.3m @ 2.1g/t Au & 0.29% Cu from 1,150.7m
- **HAD147**
  - 34.5m @ 1.9g/t Au & 0.15% Cu from 1,216.4m
- **HAD147W2**
  - 72.3m @ 1.4g/t Au & 0.07% Cu from 1,279.5m

Eastern Breccia

- **HAD084W2**
  - 212.3m at 1.20g/t Au and 0.06% Cu (calculated including intervals of internal waste >10m thick)
  - including 49.8m @ 1.5g/t Au & 0.02% Cu from 1,473m
  - and including 59.6m @ 0.89g/t Au and 0.12% Cu from 1,553.2m
  - and including 43.3m @ 2.7g/t Au & 0.06% Cu from 1,642m

Further Information on Drilling and Operations at Havieron

The Havieron copper-gold deposit is centered on a magnetic anomaly located 45km east of Telfer, and where exploration drilling by Greatland during 2018 resulted in the discovery of gold and copper mineralisation under 420m of post mineralisation cover. The Joint Venture commenced drilling during the June 2019 quarter and has completed 210,629m of drilling from 254 drill holes to date (excluding holes in progress, abandoned holes, or drill holes which have not been sampled).

Drilling activities have produced a further 26,548m of drilling from 42 drill holes since 30 June 2021. The latest assay results include results for 33 holes (18 holes completed this quarter, and 15 holes from the June quarter). Of these, 23 holes returned significant assay intercepts in excess of 50 gram metres Au (Au ppm x length metres). This announcement includes 22 new drill holes from the Infill and Growth Drilling and 11 holes reported previously in the last update ("Havieron Development and Exploration Update", dated 9 September 2021) and reported in Newcrest's Quarterly Exploration Report and listed in Appendix II.

Drilling activity during the period utilised eight drill rigs and was focused on potential resource growth at the South East Crescent Zone, Northern Breccia and Eastern Breccia, and infill drilling in the South East Crescent Zone to support the potential conversion of the Inferred Resource to Indicated. Drilling completed included:

- South East Crescent Zone Growth – assay results reported for three drill holes, and partial results for one drill hole (HAD086W3), with five holes awaiting assays.
- South East Crescent Zone Infill – assay results reported for ten drill holes, seventeen holes awaiting assays.
- Northern Breccia – assay results reported for fourteen drill holes, two holes awaiting assays.
- Eastern Breccia – assay results reported for five drill holes.

Further Growth Drilling continues to show potential for resource additions outside of the existing Inferred Mineral Resource limits, including:

- Extension of the SE Crescent Zone below the current Mineral Resource, where increasing grade and thickness of mineralisation has been observed from recent drilling
- Expansion of multiple higher-grade targets including Northern Breccia and NW Pod
- Potential for additional NW trending corridors including the Eastern Breccia

At the **South East Crescent**, Growth Drilling targeting higher grade mineralisation on 75m by 75m spacing has extended the mineralisation 250m below the initial Inferred Mineral Resource estimate. Results from three drill holes have been received, with significant results returned from HAD133W1, HAD133W3 and HAD086W3**.

Results include:

- **HAD086W3****
  - 44.7m @ 7.1g/t Au & 0.17% Cu from 1,412m** (Open Intercept)
  - Including 20.2m @ 15g/t Au & 0.29% Cu from 1,421m

- **HAD133W1^^**
  - 133m @ 7.0g/t Au & 0.05% Cu from 1,446m
  - including 55.9m @ 9.7g/t Au & 0.04% Cu from 1,449.5m
  - including 20m @ 11g/t Au & 0.04% Cu from 1,519m

- **HAD133W3**
  - 29.1m @ 3.2g/t Au & 0.09% Cu from 1,261.9m
  - 44.4m @ 5.7g/t Au & 0.11% Cu from 1,306.6m
  - 52m @ 3.2g/t Au & 0.42% Cu from 1,362m

HAD133W1^^ extended the high-grade mineralisation ~250m below the base of the Inferred Mineral Resource estimate. This intercept is ~150m below previously reported hole HAD133^^ (85m @ 11g/t Au & 0.29% Cu from 1,345m including 13m @ 32g/t Au & 0.46% Cu from 1,363m and including 14.5m @ 32g/t Au & 0.33% Cu from 1,396.5m). HAD133W3 targeted approximately 50m below the existing resource and returned a broad crescent zone intercept incorporating three discrete zones of higher grade mineralisation between 1,261.9m and 1,414m down hole with the best interval returning 44.4m @ 5.7g/t Au & 0.11% Cu from 1,306.6m. Partial assay results have been returned for HAD086W3** which returned 44.7m @ 7.1g/t Au & 0.17% Cu from 1,412m (open intercept) including 20.2m @ 15g/t Au & 0.29% Cu from 1,421m from the SE Crescent intersection located 200m below the existing Inferred Mineral Resource extents, and remains open at depth. These new intercepts show an increase in both grade and thickness with increasing depth. Drilling continues to assess the depth extents of SE Crescent which now has a vertical extent of over 900m.

A further 27 infill holes within the South East Crescent zone were completed, ten of which have returned assay results. This drilling is designed to infill the South East Crescent Inferred Mineral Resource volume to 50m x 50m spacing to support the potential upgrade of a significant portion of the Inferred Mineral Resource to Indicated Mineral Resource. Results received from infill drilling support the modelled grade and thickness within the South East Crescent Zone Mineral Resource extents. The results also support the continuity of the high grade, and in places appear to upgrade the zone, as represented by HAD117W6 120.4m @ 10g/t Au & 0.66% Cu from 764.6m. This is the best gram metre intercept drilled to date at Havieron (Au_ppm x intercept length of 1,204 gram metres Au).

Results include:

- **HAD053W3**
  - 75.4m @ 2.9g/t Au & 0.13% Cu from 987.3m
  - Including 14.7m @ 13g/t Au & 0.12% Cu from 1,031.5m
- **HAD057W7^^**
  - 23m @ 5.7g/t Au & 0.70% Cu from 613m
  - including 15m @ 8.6g/t Au & 0.96% Cu from 613m
  - 70m @ 2.2g/t Au & 0.03% Cu from 906m
  - Including 12.8m @ 5.3g/t Au & 0.02% Cu from 962.7m
- **HAD064W1**
  - 42.4m @ 2.5g/t Au & 0.08% Cu from 705.6m
  - 26.9m @ 2.3g/t Au & 0.02% Cu from 772.1m
  - Including 12m @ 4.7g/t Au & 0.02% Cu from 787m
- **HAD117W4**
  - 78.1m @ 2.1g/t Au & 0.20% Cu from 762m
  - including 13.8m @ 3.7g/t Au & 0.18% Cu from 793.9m
  - Including 10.8m @ 3.6g/t Au & 1.0% Cu from 829.4m
- **HAD117W5**
  - 111m @ 1.1g/t Au & 0.03% Cu from 715m
- **HAD117W6**
  - 120.4m @ 10g/t Au & 0.66% Cu from 764.6m
  - Including 14m @ 38g/t Au & 1.2% Cu from 845m

At the **Northern Breccia,** results from fourteen drill holes were returned and a further two drillholes are awaiting assays. The focus of the drilling in this zone is to expand the mineralisation and support potential resource growth. The latest drilling (75m x 75m) has extended the mineralised breccia footprint around the Inferred Mineral Resource extents with reported drill holes supporting extensions to breccia mineralisation. Drilling has confirmed and increased the continuity of internal higher grade Crescent-like mineralisation in a north-west mineralised corridor which now extends up to 300m in length, and 100m wide, between 4,300 – 4,100mRL, and remains open at depth.

Results include:

- **HAD069W4**
  - 22.5m @ 2.6g/t Au & 0.15% Cu from 1,281m
- **HAD081W3**
  - 52.3m @ 2.1g/t Au & 0.29% Cu from 1,150.7m
- **HAD089W3^^**
  - 106.8m @ 0.96g/t Au & 0.12% Cu from 911.2m
  - including 15m @ 2.8g/t Au & 0.21% Cu from 978m
- **HAD099W2^^**
  - 126.7m @ 0.66g/t Au & 0.07% Cu from 643.3m
  - including 12.1m @ 1.3g/t Au & 0.12% Cu from 647.1m
- **HAD138W1^^**
  - 157.4m @ 0.93g/t Au & 0.21% Cu from 937.6m
  - including 16.1m @ 5.9g/t Au & 0.12% Cu from 1,043m
- **HAD140^^**
  - 29.1m @ 9.7g/t Au & 0.29% Cu from 813.2m
- **HAD141^^**
  - 87m @ 1.8g/t Au & 0.05% Cu from 1,328m
  - including 17.8m @ 5.7g/t Au & 0.14% Cu from 1,378.5m
- **HAD147**
  - 34.5m @ 1.9g/t Au & 0.15% Cu from 1,216.4m
- **HAD147W2**
  - 72.3m @ 1.4g/t Au & 0.07% Cu from 1,279.5m

At the **Eastern Breccia,** assays for an additional five holes targeting strike extensions from previously reported drill holes HAD083 and HAD084 have been received. Interpretation of the results indicate the potential for a separate north west trending corridor, with an alteration footprint of approximately 600m, with Crescent-like higher grade zones developed internal to this Eastern Breccia. Significant assay intercepts were returned for two drill holes (HAD084W2 & HAD141^^), which has extended higher grade mineralisation up to 200m to the north west of HAD084.

Results include:

- **HAD084W2**
  - 49.8m @ 1.5g/t Au & 0.02% Cu from 1,473m
  - 59.6m @ 0.89g/t Au and 0.12% Cu from 1553.2m
  - 43.3m @ 2.7g/t Au & 0.06% Cu from 1,642m
- **HAD141^^**
  - 23m @ 1.7g/t Au & 0.01% Cu from 1,875m

HAD084W2 contains three significant intervals of mineralisation separated by weakly mineralised waste (greater than the allowable maximum consecutive internal dilution of 10m). If this internal waste is included (at the recorded grade) the interval 1473- 1685.3m is reported as 212.3m at 1.20g/t Au and 0.06% Cu. This intersection is located approximately 75m north west of HAD084, reported previously at 342.2m @ 2.0g/t Au and 0.11% Cu from 1536.8m, including 14m @ 19g/t Au, 0.2% Cu from 1572m.

Drill testing and interpretation of the geological and mineralisation controls of the Eastern Breccia Zone is ongoing.

#drilling in progress. **partial intercept, assays pending. ^updated intercept. ^^previously reported intercept.

Development Update

The development of the exploration decline continued during the period with 211 metres now complete as at 20 October 2021. Planning has commenced for the first ventilation shaft which is scheduled to begin in the next quarter. Works to progress the necessary approvals and permits that are required to commence the development of an operating underground mine and associated infrastructure at the Havieron Project are ongoing.

Background to Havieron and Joint Venture Agreement with Newcrest

The Havieron copper-gold project is operated by Newcrest under a Joint Venture Agreement with Greatland. As announced on 30 November 2020, Newcrest has now met the Stage 4 expenditure requirement to incur expenditure of US$65m and deliver a Pre-Feasibility Study to earn an additional 10% joint venture interest, resulting in an overall joint venture interest of 70% (Greatland 30%). Newcrest may acquire an additional 5% interest following completion of Stage 4 at fair market value.

The Joint Venture Agreement includes tolling principles reflecting the intention of the parties that, subject to a successful exploration programme and feasibility study and a positive decision to mine, the resulting joint venture mineralised material will be processed at Telfer, located 45km west of Havieron.

A regional map showing the Havieron licence area with regional targets and adjacent landholdings can be found at: www.greatlandgold.com/paterson

A version of this release with the full images and diagrams can be found on the Company's website: www.greatlandgold.com/media/jorc/

Figure 1. 3D Plan view schematic showing the spatial association of the South East Crescent, Northern Breccia, NW Pod and Eastern Breccia targets in relation to the Inferred Resource extents. Also highlighted are previously reported intercepts >100 gram metres (Au ppm x length) that have been intersected outside of the Inferred Mineral Resource.

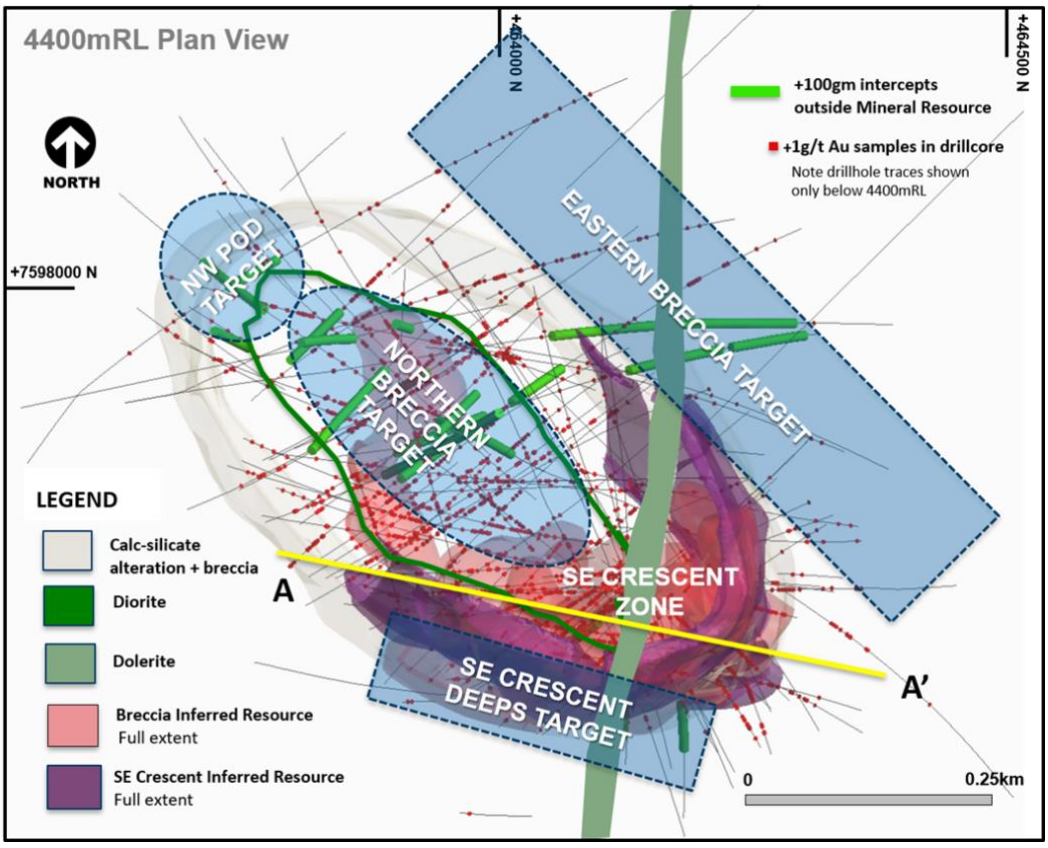

Figure 2. 3D section view schematic across section line A on Figure 1, highlighting selected South East Crescent growth intercepts below the current Inferred Resource.

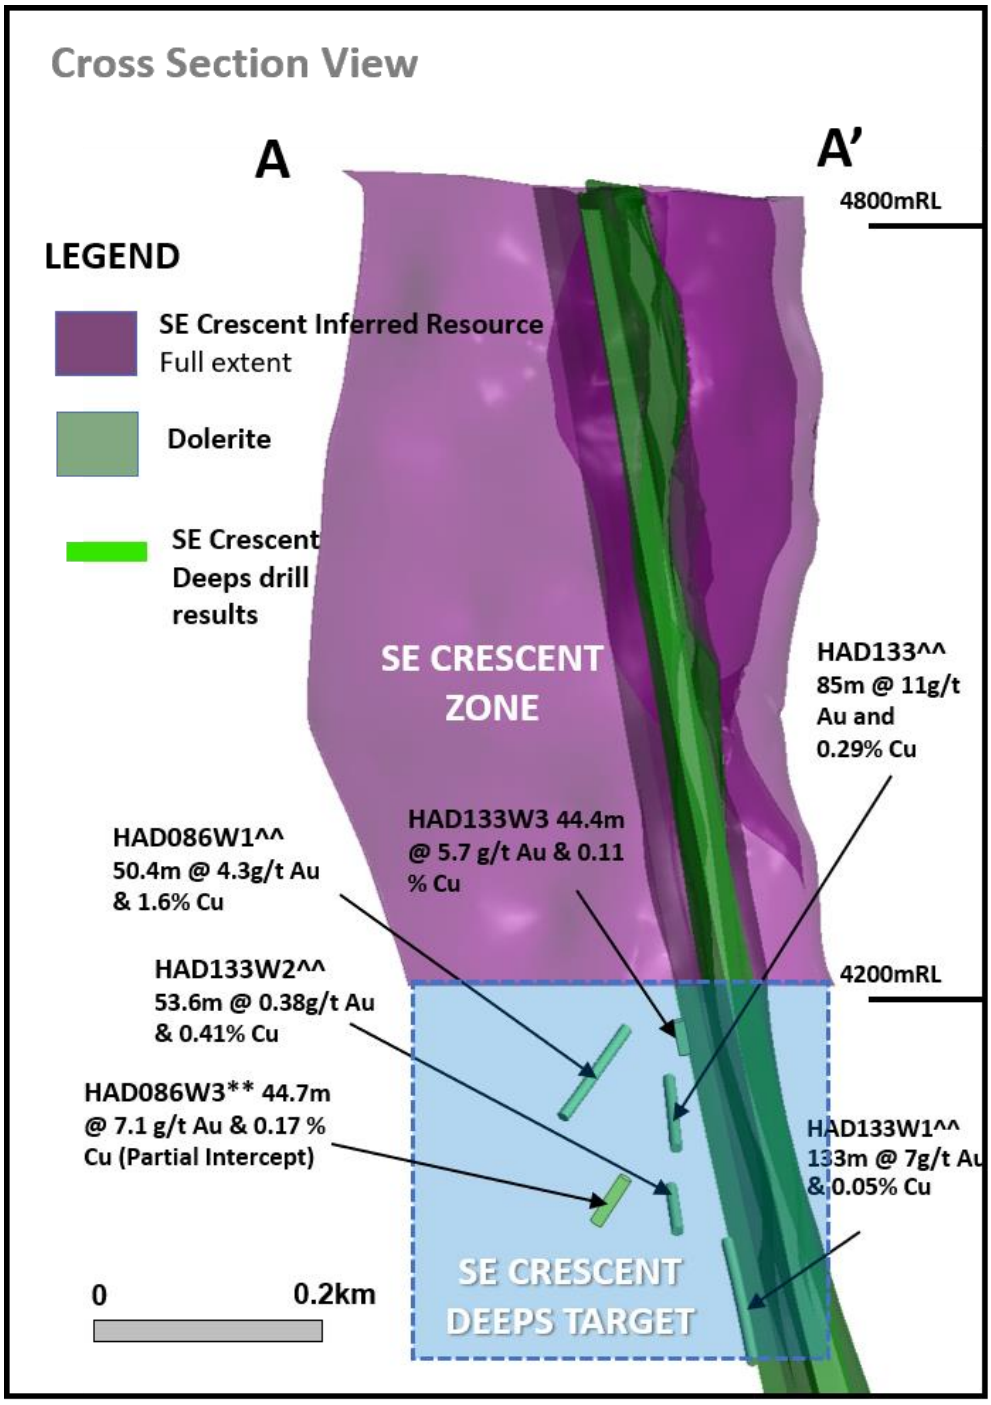

Figure 3. Plan view schematic of a horizontal slice at 4300mRL through the Crescent Sulphide Zone and Breccia-hosted Zones, showing the extents of the 0.5 and 1.0 g/t Au Leapfrog™ grade shells with highlighted newly reported intercepts for this period. Also shown is the Eastern Breccia mineralisation outline projected to the 4300mRL section -drilling is ongoing to confirm the extent of these zones. This diagram highlights >50gram metres intersections drilled during the quarter, refer to inset diagram for relationship to all Havieron drilling.

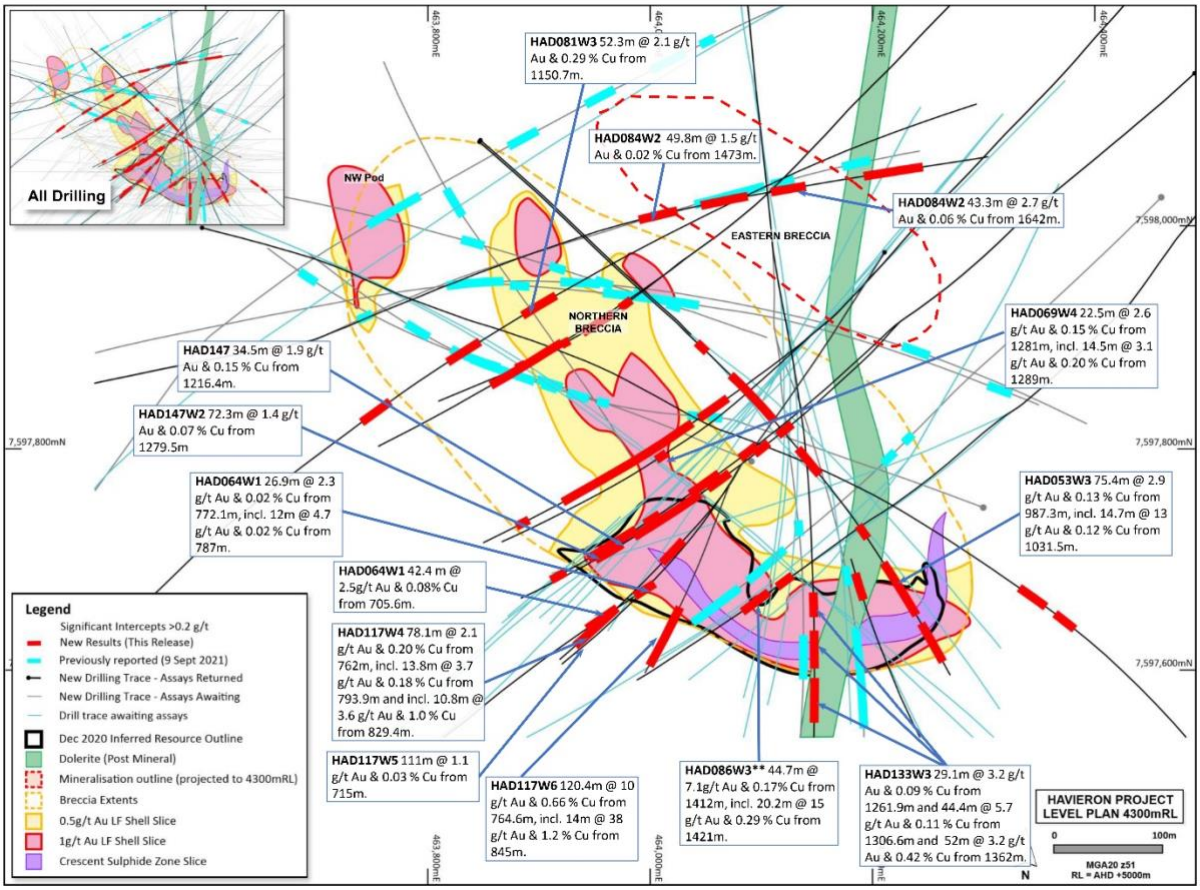

Figure 4. Schematic plan view map showing drill hole locations and significant intercepts reported in this release superimposed on the interpreted geology. Previously reported holes are not shown for the sake of clarity. Note some holes and results appear on multiple sections due to the sections orientation and sections overlap.

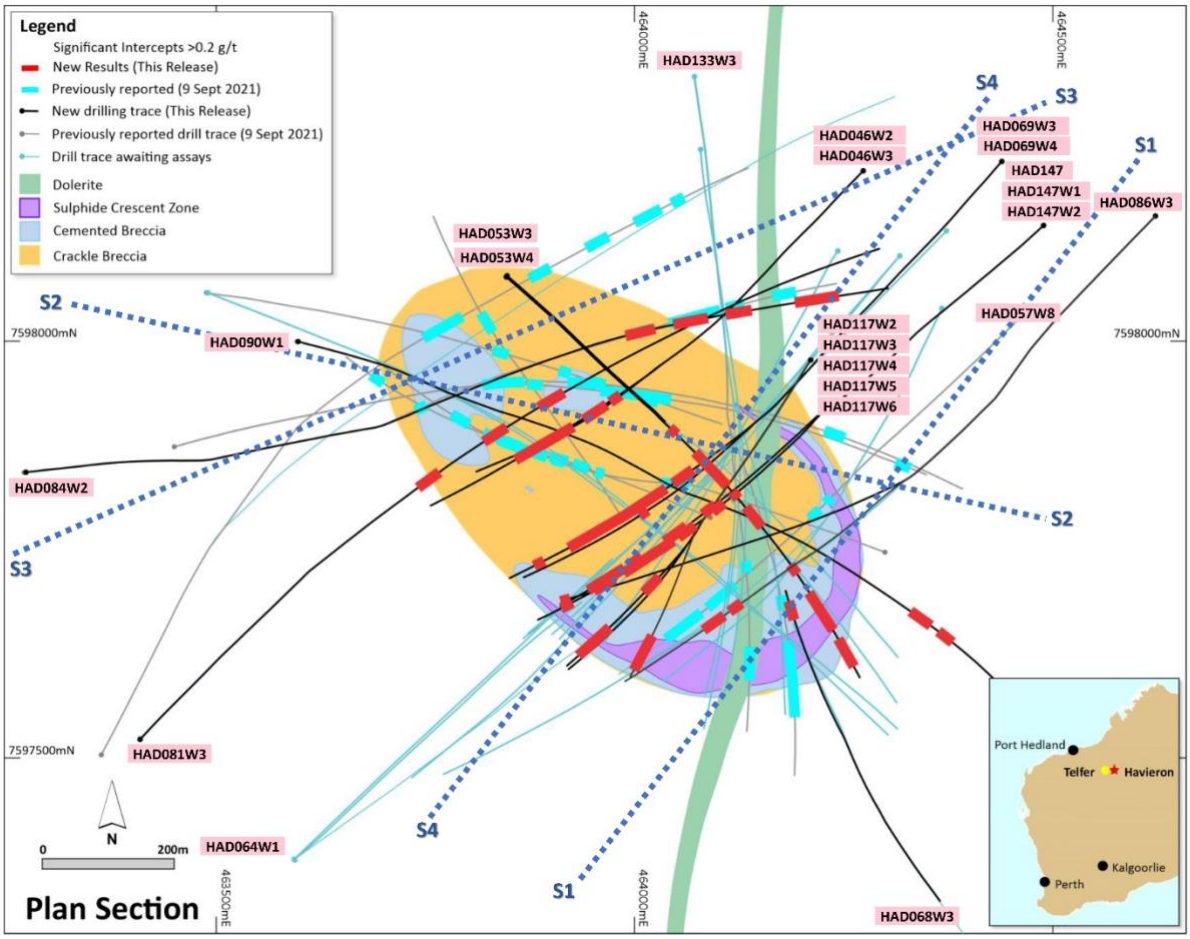

Figure 5. Schematic cross section of geology and significant new drillhole intercepts (looking northwest, Section Line S1, +/-100m section width, as shown in Figure 4). Due to section window size and orientation holes may appear on multiple sections

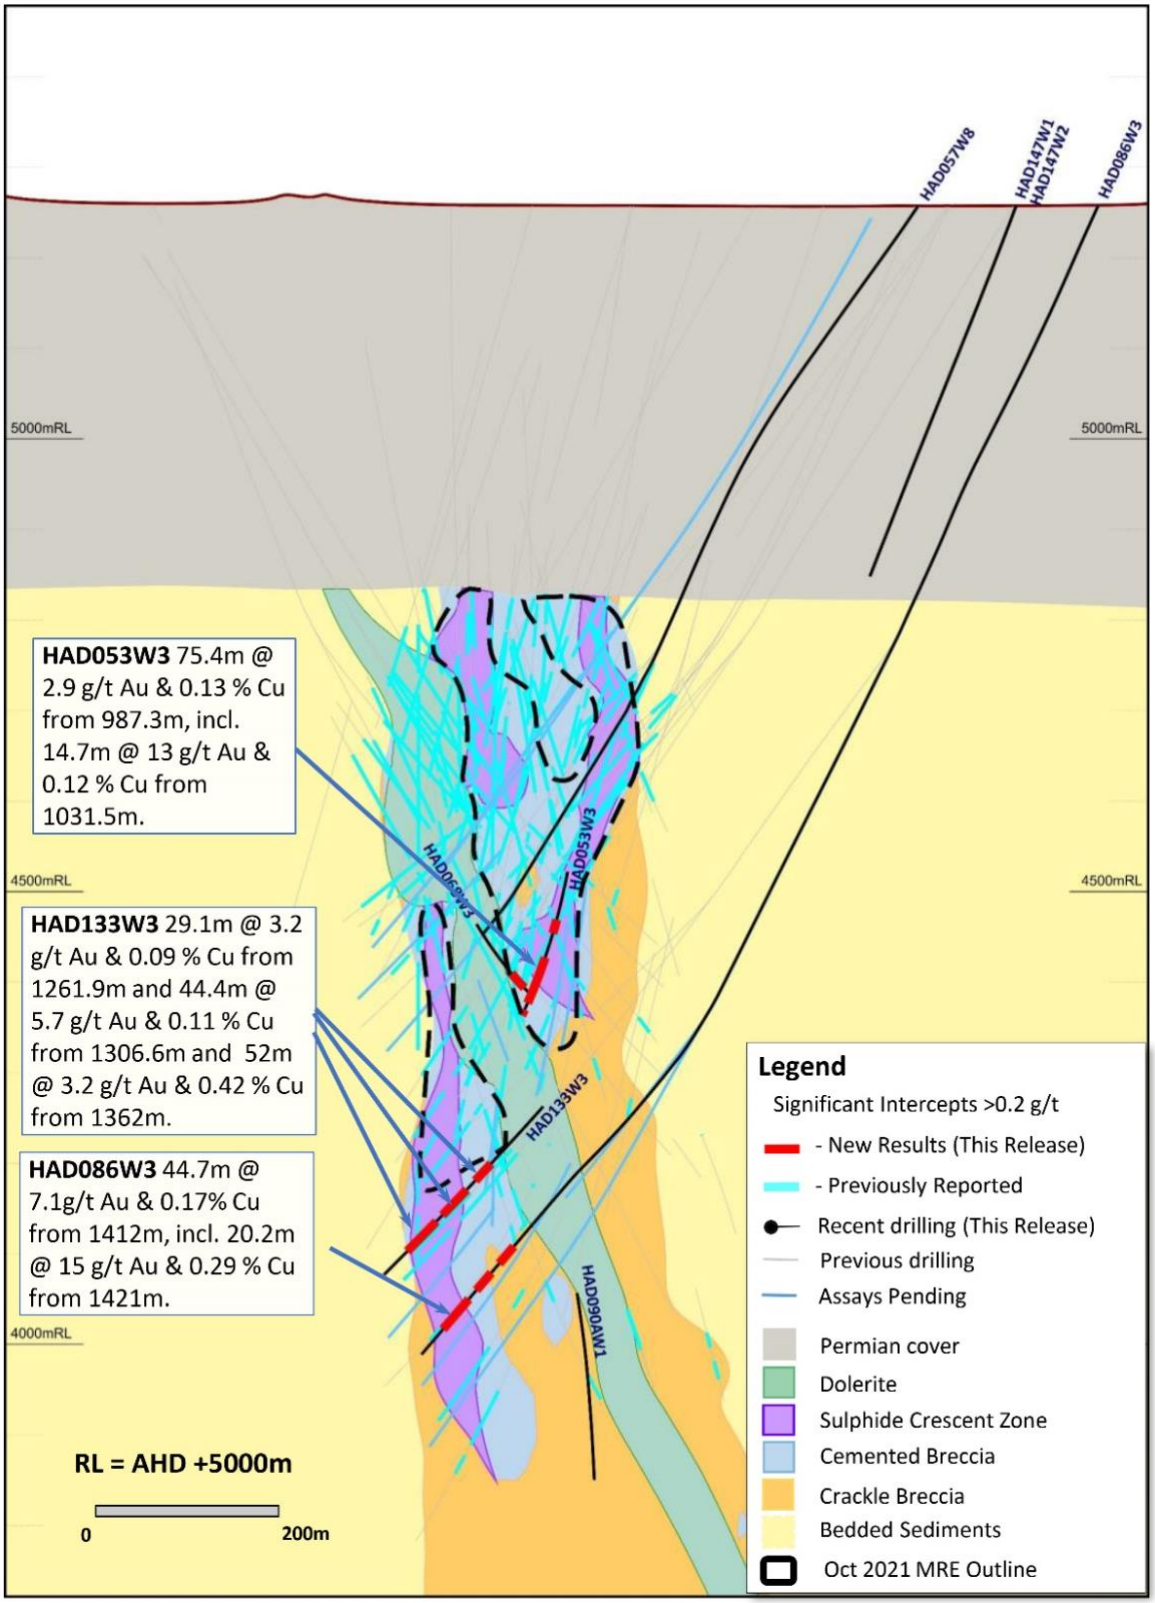

Figure 6. Schematic cross section of geology and significant new drillhole intercepts (looking northwest, Section Line S2, +/-100m section width, as shown in Figure 4). Due to section window size and orientation holes may appear on multiple sections.

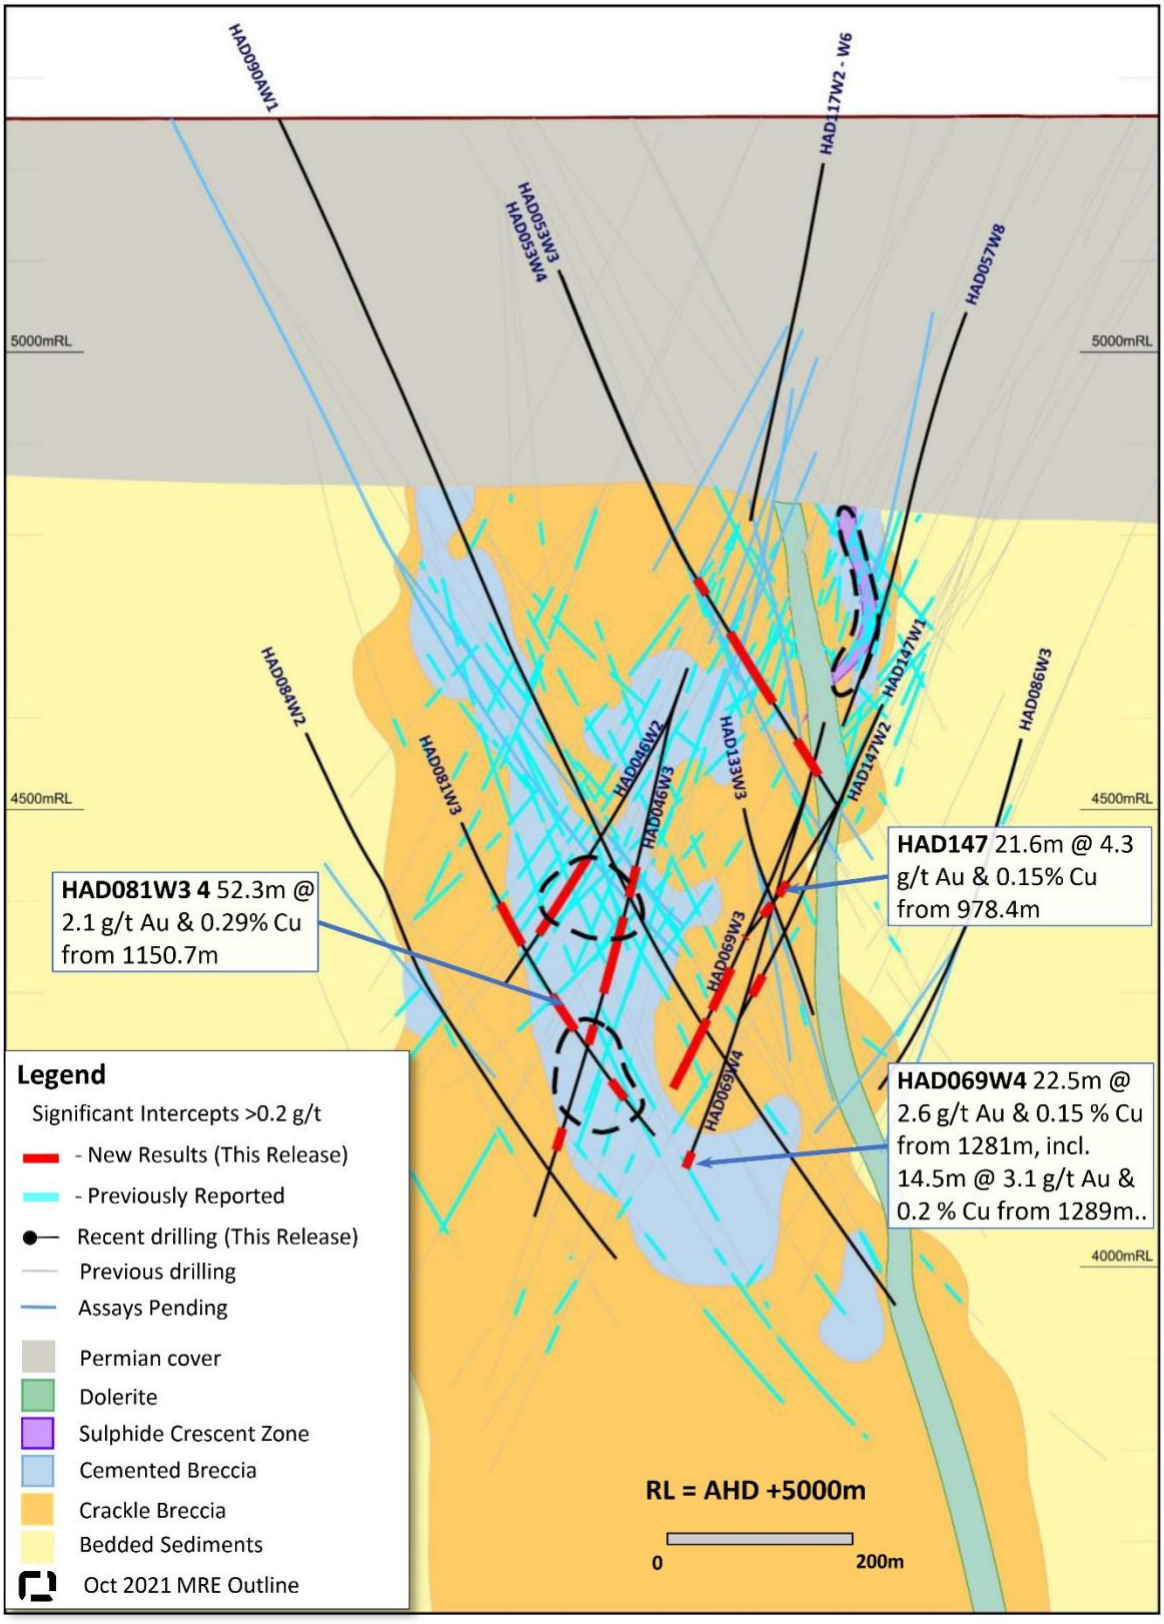

Figure 7. Schematic cross section of geology and significant new drillhole intercepts (looking northwest, Section Line S3, +/-100m section width, as shown in Figure 4). Due to section window size and orientation holes may appear on multiple sections

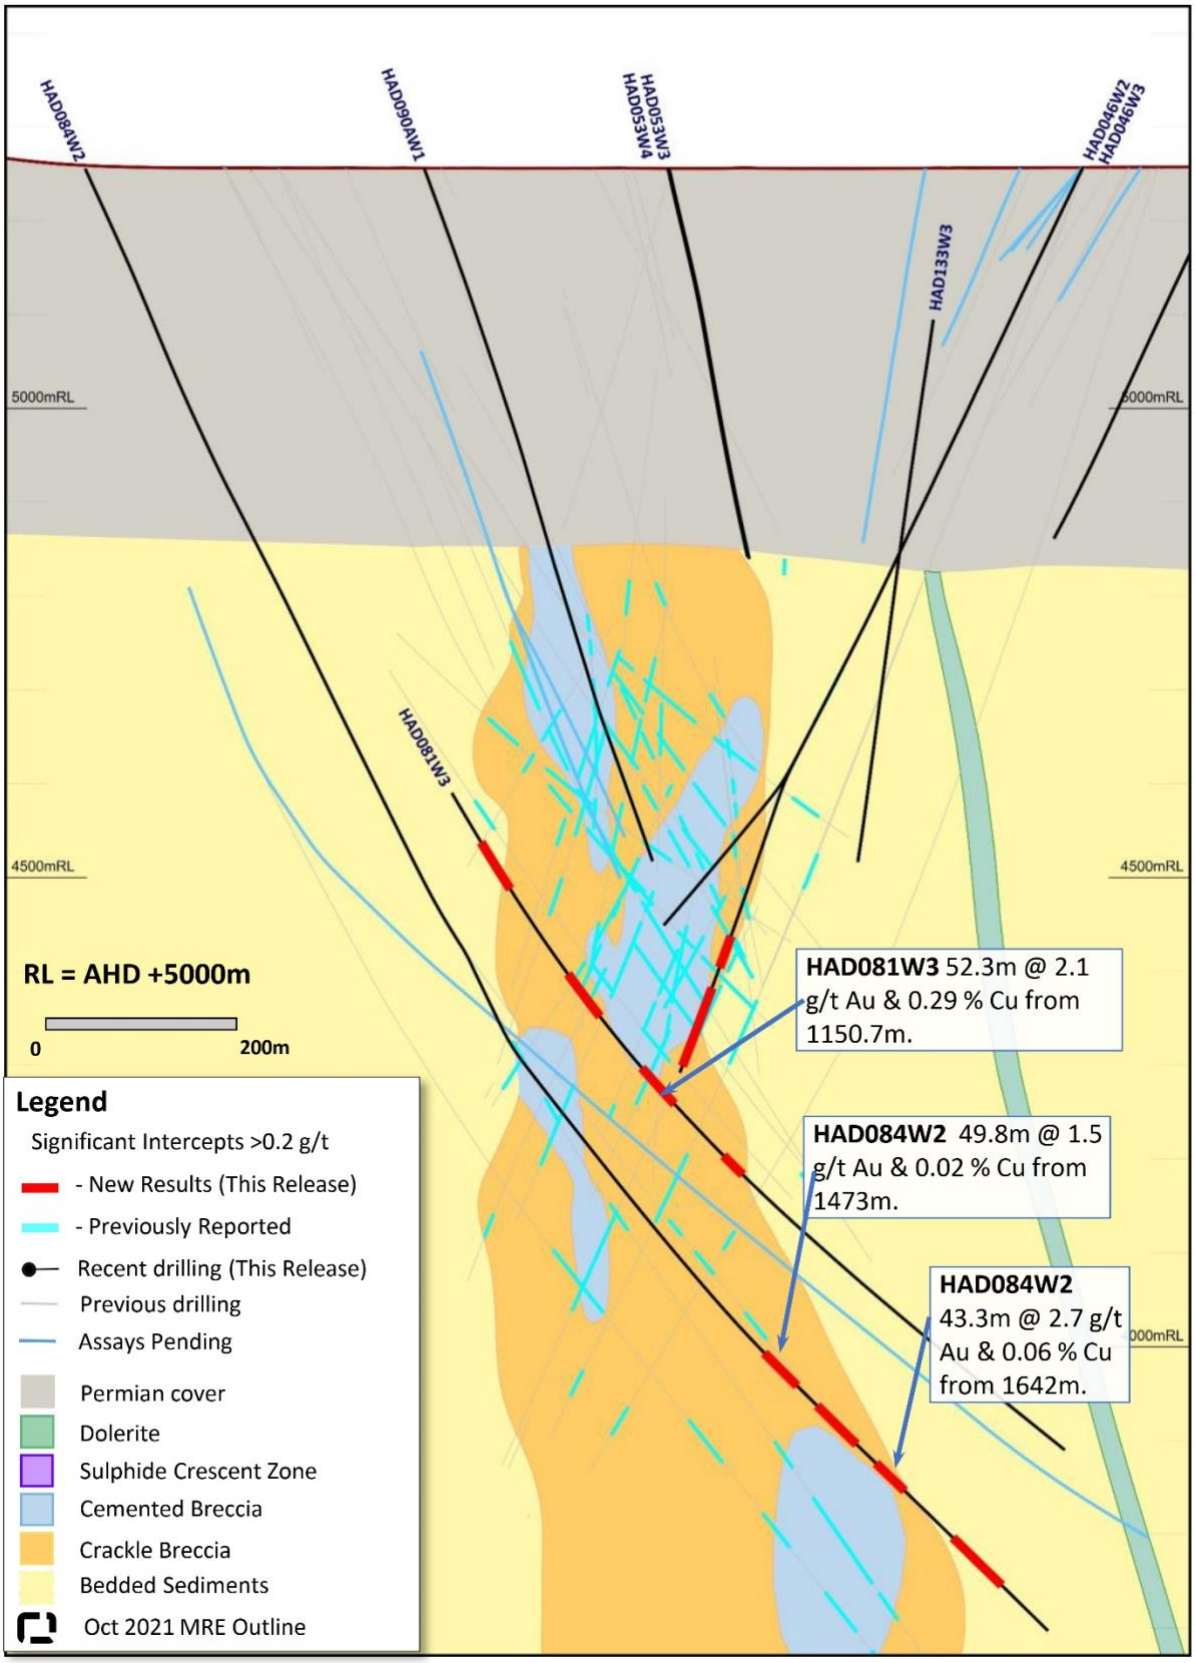

Figure 8. Schematic cross section of geology and significant new drillhole intercepts (looking northwest, Section Line S4, +/-100m section width, as shown in Figure 4). Due to section window size and orientation holes may appear on multiple sections.

"First Results from Newcrest's Drilling Campaign at Havieron", dated 25 July 2019 (Greatland)
"Newcrest Quarterly Exploration Report – June 2019", dated 25 July 2019 (Newcrest)

Information in this announcement pertaining to Reporting of Exploration Results, which has been taken from Newcrest Mining Limited's announcement titled "Exploration Update", dated 9 September 2021, has been reviewed and approved by Mr John McIntyre, a Member of the Australian Institute of Geoscientists (MAIG), who has more than 30 years relevant industry experience. Mr McIntyre is an employee of the Company and has no financial interest in Greatland Gold plc or its related entities. Mr McIntyre has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code) and under

the AIM Rules - Note for Mining and Oil & Gas Companies, which outline standards of disclosure for mineral projects. Mr McIntyre consents to the inclusion in this announcement of the matters based on this information in the form and context in which it appears. Mr McIntyre confirms that the Company is not aware of any new information or data that materially affects the information included in the relevant market announcements, and that the form and context in which the information has been presented has not been materially modified.

Additional information on the project can be found on the Company's website at https://greatlandgold.com/projects/havieron/

In addition to this release, a PDF version of this report with supplementary information can be found at the Company's website: www.greatlandgold.com/media/jorc

Notes for Editors:

Greatland Gold plc (AIM:GGP) is a leading mining development and exploration company with a focus on precious and base metals. The Company's flagship asset is the world-class Havieron gold-copper deposit in the Paterson region of Western Australia, discovered by Greatland and presently under development in Joint Venture with Newcrest Mining Ltd.

Havieron is located approximately 45km east of Newcrest's Telfer gold mine and, subject to positive decision to mine, will leverage the existing infrastructure and processing plant to significantly reduce the project's capital expenditure and carbon impact for a low-cost pathway to development. An extensive growth drilling programme is presently underway at Havieron with a maiden Pre-Feasibility Study released on the South-East crescent on 12 October 2021. Construction of the box cut and decline to develop the Havieron deposit commenced in February 2021.

Greatland has a proven track record of discovery and exploration success. It is pursuing the next generation of tier-one mineral deposits by applying advanced exploration techniques in under-explored regions. The Company is focused on safe, low-risk jurisdictions and is strategically positioned in the highly prospective Paterson region. Greatland has a total six projects across Australia with a focus on becoming a multi-commodity mining company of significant scale.

APPENDIX I

Havieron Project (Greatland Gold plc – Joint Venture Agreement): JORC Table 1

Section 1 Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Core samples are obtained from core drilling in Proterozoic basement lithologies. PQ-HQ and NQ diameter core was drilled on a 6m run. Core was cut using an automated core-cutter and half core sampled at 1m intervals with breaks for major geological changes. Sampling intervals range from 0.2 – 1.0m. Cover sequences were not sampled.
Drilling techniques	Permian Paterson Formation cover sequence was drilled using mud rotary drilling. Depths of cover typically observed to approximately 420m vertically below surface. Steel casing was emplaced to secure the pre-collar. Core drilling was advanced from the base of the cover sequence with PQ3, HQ3 and NQ2 diameter coring configuration. Core from inclined drill holes are oriented on 3m and 6m runs using an electronic core orientation tool (Reflex ACTIII). At the end of each run, the bottom of hole position is marked by the driller, which is later transferred to the whole drill core run length with a bottom of hole reference line.
Drill sample recovery	Core recovery is systematically recorded from the commencement of coring to end of hole, by reconciling against driller's depth blocks in each core tray with data recorded in the database. Drillers depth blocks provided the depth, interval of core recovered, and interval of core drilled. Core recoveries were typically 100%, with isolated zones of lower recovery. Cover sequence drilling by the mud-rotary drilling did not yield recoverable samples.
Logging	Geological logging recorded qualitative descriptions of lithology, alteration, mineralisation, veining, and structure (for all core drilled 10,375m for 18 drill holes, all intersecting mineralisation), including orientation of key geological features. Geotechnical measurements were recorded including Rock Quality Designation (RQD) fracture frequency, solid core recovery and qualitative rock strength measurements. Magnetic susceptibility measurements were recorded every metre. The bulk density of selected drill core intervals was determined at site on whole core samples. All geological and geotechnical logging was conducted at the Havieron site. Digital data logging was captured on diamond drill core intervals only, and all data validated and stored in an acQuire database. All drill cores were photographed, prior to cutting and/or sampling the core. The logging is of sufficient quality to support Mineral Resource estimates.
Sub-sampling techniques and sample preparation	Sampling, sample preparation and quality control protocols are considered appropriate for the material being sampled. Core was cut and sampled at the Telfer and Havieron core processing facility. Half core samples of between 0.2 and 2.0 m were collected in pre-numbered calico bags and grouped in plastic bags for dispatch to the laboratory. Sample weights typically varied from 0.5 to 8kg. Sample sizes are considered appropriate for the style of mineralisation. Drill core samples were freighted by air and road to the laboratory. Sample preparation was conducted at the independent ISO17025 accredited Intertek Laboratory, Perth (Intertek). Samples were dried at 105°C, and crushed to 95% passing 4.75mm, and the split to obtain up to 3kg sub-sample, which was pulverised (using LM5) to produce a pulped product with the minimum standard of 95% passing 106µm. Routine grind size analysis is conducted. Duplicate samples were collected from crush and pulp samples at a rate of 1:20. Duplicate results show an acceptable level of variability for the material sampled and style of mineralisation. Periodic size checks (1:20) for crush and pulp samples and sample weights are provided by the laboratory and recorded in the acQuire database.
Quality of assay data and laboratory tests	Assaying of drill core samples was conducted at Intertek. All samples were assayed for 48 elements using a 4-acid digestion followed by ICP-AES/ICP-MS determination (method 4A/MS907), which is considered to provide a total assay for copper. Gold analyses were determined by 50g fire assay with AAS finish (method FA50N/AA), which is considered to provide a total assay for gold. Sampling and assaying quality control procedures consisted of inclusion of certified reference material (CRMs), coarse residue and pulp duplicates with each batch (at least 1:20). Assays of quality control samples were compared with reference samples in acQuire database and verified as acceptable prior to use of data from analysed batches.

Criteria	Commentary
	Laboratory quality control data, including laboratory standards, blanks, duplicates, repeats and grind size results are captured in the acQuire database and assessed for accuracy and precision for recent data. Extended quality control programmes including pulp samples submitted to an umpire laboratory and combined with more extensive re-submission programmes have been completed. Analysis of the available quality control sample assay results indicates that an acceptable level of accuracy and precision has been achieved and the database contains no analytical data that has been numerically manipulated. The assaying techniques and quality control protocols used are considered appropriate for the data to be used for reporting exploration drilling results.
Verification of sampling and assaying	Sampling intervals defined by the geologist are electronically assigned sample identification numbers prior to core cutting. Corresponding sample numbers matching pre-labelled calico bags are assigned to each interval. All sampling and assay information were stored in a secure acQuire database with restricted access. Electronically generated sample submission forms providing the sample identification number accompany each submission to the laboratory. Assay results from the laboratory with corresponding sample identification are loaded directly into the acQuire database. Assessment of reported significant assay intervals was verified by re-logging of diamond drill core intervals and assessment of high resolution core photography. The verification of significant intersections has been completed by Newcrest personnel and Newcrest's Competent Person/Qualified Person. John McIntyre, Greatland's Competent Person, has reviewed and validated the significant intersections. No adjustments are made to assay data, and no twinned holes have been completed. There are no currently known drilling, sampling, recovery, or other factors that could materially affect the accuracy or reliability of the data.
Location of data points	Drill collar locations were surveyed using a differential GPS with GNSS with a stated accuracy of +/- 0.5m for all drill holes reported. Drill rig alignment was attained using an electronic azimuth aligner. Downhole survey was collected at 6-12m intervals in the cover sequence, and every 6 to 30m in diamond drill core segments of the drill hole using single shot (Axis Mining Champ Gyro). The single shot surveys have been validated using continuous survey to surface (Axis Mining Champ) along with a selection of drill holes re-surveyed by an external survey contactor using a DeviGyro tool - confirming sufficient accuracy for downhole spatial recording. A LIDAR survey was completed over the project area in Nov 2019 which was used to prepare a DEM / topographic model for the project with a spatial accuracy of +/- 0.1m vertical and +/- 0.3m horizontal. The topography is generally low relief to flat, elevation within the dune corridors in ranges between 250-265m Australian Height Datum (AHD) steepening to the southeast. All collar coordinates are provided in the Geocentric Datum of Australian (GDA20 Zone 51). All relative depth information is reported in AHD +5000m.
Data spacing and distribution	Within the South-East Crescent and Breccia zone drill hole spacing ranges from 50 to 100m, to 50 by 50m within the initial resource extents. Outside the initial resource boundary drill hole spacing ranges from 50 to 200m in lateral extent within the breccia zone over an area of ~2km^2. The data spacing is sufficient to establish the degree of geological and grade continuity. Significant assay intercepts remain open. Further drilling is required to determine the extent of currently defined mineralisation. No sample compositing is applied to samples. Drilling intersects mineralisation at various angles.
Orientation of data in relation to geological structure	Drill holes exploring the extents of the Havieron mineral system intersect moderately dipping carbonate and siliclastic sedimentary facies, mineralised breccia and sub-vertical intrusive lithologies. Geological modelling has been interpreted from historic and Newcrest drill holes. Variable brecciation, alteration and sulphide mineralisation is observed with a footprint with dimensions of 650m x 350m trending in a north west orientation and over 1,000m in vertical extent below cover. The subvertical southeast high grade arcuate crescent sulphide zone has an average thickness of 20m and has been defined over a strike length of up to 550m, and over 700m in vertical extent below cover. Drilling direction is oriented to intersect the steeply dipping high-grade sulphide mineralisation zones at an intersection angle of greater than 40 degrees. The drilled length of reported intersections is typically greater than true width of mineralisation.
Sample security	The security of samples is controlled by tracking samples from drill rig to database. Drill core was delivered from the drill rig to the Havieron core yard every shift. On completion of geological and geotechnical logging, core processing was completed by Newcrest personnel at the Telfer facility but subsequently completed at the Havieron facility.

Criteria	Commentary
	High resolution core photography and cutting of drill core was undertaken at the Havieron or Telfer core processing facilities. Samples were freighted in sealed bags by air and road to the Laboratory, and in the custody of Newcrest representatives. Sample numbers are generated directly from the database. All samples are collected in pre-numbered calico bags. Verification of sample numbers and identification is conducted by the laboratory on receipt of samples, and sample receipt advise issued to Newcrest. Details of all sample movement are recorded in a database table. Dates, Hole ID sample ranges, and the analytical suite requested are recorded with the dispatch of samples to analytical services. Any discrepancies logged at the receipt of samples into the analytical services are validated.
Audits or reviews	Internal reviews of core handling, sample preparation and assays laboratories were conducted on a regular basis by both project personnel and owner representatives. In the Competent Person's opinion, the sample preparation, security and analytical procedures are consistent with current industry standards and are entirely appropriate and acceptable for the styles of mineralisation identified and will be appropriate for use in the reporting of exploration results and Mineral Resource estimates. There are no identified drilling, sampling or recovery factors that materially impact the adequacy and reliability of the results of the drilling programme in place at the Havieron Project.

Section 2 Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	The Havieron Project is entirely contained within mining tenement M45/1287, which is jointly owned by Greatland Pty Ltd and Newcrest Operations Limited. Newcrest has entered into a Joint Venture Agreement (effective 30 November 2020) and Farm-In Agreement (effective 12 March 2019) with Greatland Pty Ltd and Greatland Gold plc. Newcrest is the manager of the Havieron Project. Newcrest has now met the Stage 4 expenditure requirement to incur expenditure of US$65m and deliver a Pre-Feasibility Study to earn an additional 10% joint venture interest, resulting in an overall joint venture interest of 70%. Newcrest has the right to acquire a further 5% at fair market value within 14 months of completing Stage 4. Newcrest and the Western Desert Lands Aboriginal Corporation are parties to an Indigenous Land Use Agreement (ILUA) which relates to the use of native title land for Newcrest's current operations at Telfer and its activities within a 60-km radius around Telfer and includes its exploration activities at Havieron. The parties have agreed that the ILUA will apply to any future development activities by the Joint Venture Participants (Newcrest and Greatland Gold) at Havieron.
Exploration done by other parties	Newcrest completed six core holes in the vicinity of the Havieron Project from 1991 to 2003. Greatland Gold completed drill targeting and drilling of nine Reverse Circulation (RC) drill holes with core tails for a total of approximately 6,800m in 2018. Results of drilling programmes conducted by Greatland Gold have previously been reported on the Greatland Gold website. Drilling has defined an intrusion-related mineral system with evidence of breccia and massive sulphide-hosted higher-grade gold-copper mineralisation.
Geology	The Havieron Project is located within the north-western exposure of the Palaeo-Proterozoic to Neoproterozoic Paterson Orogen (formerly Paterson Province), 45 km east of Telfer. The Yeneena Supergroup hosts the Havieron prospect and consists of a 9km thick sequence of marine sedimentary rocks and is entirely overlain by approximately 420m of Phanerozoic sediments of the Paterson Formation and Quaternary aeolian sediments. Gold and copper mineralisation at Havieron consist of breccia, vein and massive sulphide replacement gold and copper mineralisation typical of intrusion-related and skarn styles of mineralisation. Mineralisation is hosted by metasedimentary rocks (meta-sandstones, meta-siltstones and meta-carbonate) and intrusive rocks of an undetermined age. The main mineral assemblage contains well developed pyrrhotite-chalcopyrite and pyrite sulphide mineral assemblages as breccia and vein infill, and massive sulphide lenses. The main mineralisation event is associated with amphibole-carbonate-biotite-sericite-chlorite wall rock alteration. Drilling has partially defined the extents of mineralisation which are observed over 650m by 350m within an arcuate shaped mineralised zone, and to depths of up to 1400m below surface.
Drill hole Information	As provided in Appendix II.
Data aggregation methods	Significant assay intercepts are reported as (A) length-weighted averages exceeding 1.0g/t Au greater than or equal to 10m, with a maximum of 5m consecutive internal dilution; and (B) length-weighted averages exceeding 0.2g/t Au for greater than or equal to 20m, with a maximum of 10m consecutive internal dilution, and (C) intervals of >30g/t with no internal dilution which are greater or equal to 30 gram metres (Au_ppm x length). No top cuts are applied to intercept calculations. WAD084W2 has been reported with a composited interval including intervals of consecutive internal dilution >10m (but less than 30m).

Relationship between mineralisation widths and intercept lengths	Significant assay intervals reported represent apparent widths. Drilling is not always perpendicular to the dip of mineralisation and true widths are less than downhole widths. Estimates of true widths will only be possible when all results are received, and final geological interpretations have been completed.
Diagrams	Figures 1 through 7 as provided.
Balanced reporting	This is the nineteenth release of Exploration Results for this project made by Newcrest and Greatland Gold. Previous release dates are 25 July 2019, 10 September 2019, 24 October 2019, 2 December 2019, 30 January 2020, 11 March 2020, 30 April 2020, 11 June 2020, 23 July 2020, 10 September 2020, 29 October 2020, 10 December 2020, 28 January 2021, 11 March 2021, 29 April 2021, 10 June 2021, 22 July 2021 and 9 September 2021. Earlier reporting of exploration programmes conducted by Newcrest and Greatland Gold have previously been reported. Exploration drilling programmes are ongoing and further material results will be reported in subsequent Newcrest releases.
Other substantive exploration data	Nil
Further work	Growth drilling is planned to extend the December 2020 Inferred Mineral Resource estimate and define the limits of the Havieron mineralised system.

APPENDIX II

Drillhole Data

Havieron Project, Paterson Province, Western Australia

*Reporting Criteria: Intercepts reported are downhole drill width (not true width) Au >0.20ppm (0.2g/t Au) and minimum 20m downhole width with maximum consecutive internal dilution of 10m. Average grades are based on length-weighting of uncut sample grades. Also highlighted are high grade intervals of Au >1.0ppm (1g/t Au) and minimum 10m downhole width with maximum consecutive internal dilution of 5m, and intervals of >30g/t with no internal dilution which are greater or equal to 30 gram metres (Au_ppm x length) are tabled. Gold grades are reported to two significant figures, the downhole lengths are rounded to 0.1m which may cause some apparent discrepancies in interval widths. Samples are from core drilling which is PQ, HQ or NQ in diameter. Core is photographed and logged by the geology team before being cut. Half core PQ, HQ and NQ samples are prepared for assay and the remaining material is retained in the core farm for future reference. Each assay batch is submitted with duplicates and standards to monitor laboratory quality. Total depth (end of hole) is rounded to one decimal place for reporting purposes. Collars denoted with a * show partial results, with further significant assays to be reported in subsequent exploration updates.*
